STIHL®

STIHL MS 201

Instruction Manual

Contents

Dear Customer,

Thank you for choosing a quality engineered STIHL product.

It has been built using modern production techniques and comprehensive quality assurance. Every effort has been made to ensure your satisfaction and troublefree use of the product.

Please contact your dealer or our sales company if you have any queries concerning this product.

Your

Dr. Nikolas Stihl

Original Instruction Manual

Printed on chlorine-free paper
Printing inks contain vegetable oils, paper can be recycled.

STIHL®

Guide to Using this Manual

This Instruction Manual refers to a STIHL chain saw, also called a machine in this Instruction Manual.

Pictograms

Pictograms that appear on the machine are explained in this Instruction Manual.

Depending on the machine and equipment version, the following pictograms may appear on the machine.

Fuel tank; fuel mixture of gasoline and engine oil

Tank for chain oil; chain oil

Engage and release chain brake

Coasting brake

Direction of chain travel

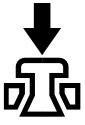
Ematic; chain oil flow adjustment

Tension saw chain

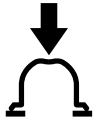
Intake air baffle: winter operation

Intake air baffle: summer operation

Handle heating



Actuate decompression valve



Actuate manual fuel pump

Symbols in text

WARNING

Warning where there is a risk of an accident or personal injury or serious damage to property.

NOTICE

Caution where there is a risk of damaging the machine or its individual components.

Engineering improvements

STIHL's philosophy is to continually improve all of its products. For this reason we may modify the design, engineering and appearance of our products periodically.

Therefore, some changes, modifications and improvements may not be covered in this manual.

Safety Precautions

Special safety precautions must be observed to reduce the risk of personal injury when working with a chain saw because of the very high chain speed and very sharp cutters.

It is important that you read the instruction manual before first use and keep it in a safe place for future reference. Non-observance of the instruction manual may result in serious or even fatal injury.

General

Observe all applicable local safety regulations, standards and ordinances.

The use of noise emitting power tools may be restricted to certain times by national or local regulations.

If you have not used this model before: Have your dealer or other experienced user show you how to operate your machine or attend a special course in its operation.

Minors should never be allowed to use a chain saw.

Keep bystanders, especially children, and animals away from the work area.

The user is responsible for avoiding injury to third parties or damage to their property.

Do not lend or rent your chain saw without the instruction manual. Be sure that anyone using it understands the information contained in this manual.

To operate a chain saw you must be rested, in good physical condition and mental health. If you have any condition that might be aggravated by strenuous work, check with your doctor before operating a chain saw.

Do not operate the chain saw if you are under the influence of any substance (drugs, alcohol) which might impair vision, dexterity or judgment.

To reduce the risk of accidents or injury, put off the work in poor weather conditions (rain, snow, ice, wind).

Persons with pacemakers only: The ignition system of your chainsaw produces an electromagnetic field of a very low intensity. This field may interfere with some pacemakers. To reduce health risks, STIHL recommends that persons with pacemakers consult their physician and the pacemaker manufacturer before operating this power tool.

Intended use

The machine may only be used to saw wood and wooden objects.

Do not the machine for any other purpose – risk of accidents!

Do not modify the machine in any way – this may increase the risk of personal injury. STIHL excludes all liability for personal injury and damage to property caused while using unauthorised attachments.

Clothing and Equipment

Wear proper protective clothing and equipment.

Clothing must be sturdy but allow complete freedom of movement. Wear snug-fitting clothing with **cut retardant inserts** – do not wear a work coat.

Avoid clothing that could get caught on branches or brush or moving parts of the saw. Do not wear a scarf, necktie or jewelry. Tie up and confine long hair (e.g. with a hair net, cap, hard hat, etc.).

Wear steel-toed **safety boots** with cut retardant inserts and non-slip soles.

WARNING

To reduce the risk of eye injuries, wear snug-fitting safety glasses in accordance with European Standard EN 166. Make sure the safety glasses are a good fit.

Wear a face shield and make sure it is a good fit. A face shield alone does not provide adequate eye protection.

Wear hearing protection, e.g. earplugs or ear muffs.

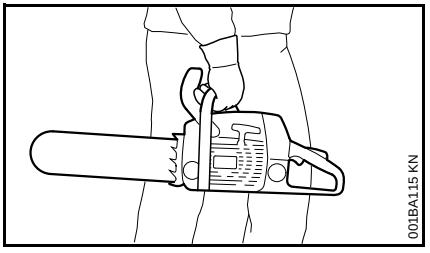
Wear a safety hard hat where there is a danger of head injuries from falling objects.

Wear heavy-duty work gloves made of durable material (e.g. leather).

STIHL offers a comprehensive range of personal protective clothing and equipment.

Transport

Before any transport – even over short distances – switch off the machine, engage the chain brake and attach the chain scabbard. This avoids the risk of the saw chain starting unintentionally.



Always carry the chain saw by the handle – with the hot muffler away from your body, the guide bar must point to the rear. Avoid touching hot parts of the machine, especially the surface of the muffler – risk of burns!

In vehicles: Properly secure the machine to prevent tipping, damage and chain oil or fuel spillage.

Cleaning

Clean plastic parts with a cloth. Harsh detergents can damage the plastic.

Clean the dust and dirt off the machine – do not use any grease solvents for this purpose.

Clean the ventilation slots if necessary.

Do not use a high-pressure cleaner to clean the machine. The hard jet of water can damage parts of the machine.

Accessories

Only use those tools, guide bars, chains, chain sprockets, accessories or technically equivalent components that have been approved by STIHL for this machine. If you have any questions in this respect, consult a servicing dealer. Use only high quality tools and accessories. Otherwise, there may be a risk of accidents and damage to the machine.

STIHL recommends the use of genuine STIHL tools, guide bars, chains, chain sprockets and accessories. They are specifically designed to match your model and meet your performance requirements.

Refuelling

Petrol is an extremely flammable fuel – keep clear of naked flames and fire – do not spill any fuel – no smoking.

Switch off the engine before refuelling.

Never refuel the machine while the engine is still hot – the fuel may spill over – **risk of fire!**

Open the fuel filler cap carefully so that any excess pressure is relieved gradually and fuel does not splash out.

The machine may only be refuelled in a well ventilated place. Clean the machine immediately if fuel is spilled. Do not spill fuel over your clothing – contaminated clothing must be changed immediately.

The machines can be equipped with the following filler caps as standard:

Cliplock filler cap (bayonet-type)

Place the cliplock filler cap (bayonet-type) in position, turn as far as stop and fold the cliplock down.

This helps reduce the risk of unit vibrations causing an incorrectly tightened filler cap to loosen or come off and spill quantities of fuel.

Look out for leaks! Never start the engine if fuel has been spilled or is leaking – **Fatal burns may result!**

Before Starting Work

Check that your saw is properly assembled and in good condition – refer to appropriate chapters in the instruction manual.

– Check the fuel system for leaks, paying special attention to visible parts such as the tank cap, hose connections and the manual fuel pump (on machines so equipped). If

there are any leaks or damage, do not start the engine – **risk of fire**. Have your saw repaired by a servicing dealer before using it again.

- Check operation of chain brake, front hand guard
- Correctly mounted guide bar
- Correctly tensioned chain
- The trigger and trigger lockout must move freely and spring back to the idle position when they are released.
- Master Control lever must move easily to **STOP**, **0** or ⌽
- Check that the spark plug boot is secure – a loose boot may cause arcing that could ignite combustible fumes **and cause a fire**.
- Never attempt to modify the controls or safety devices in any way.
- Keep the handles dry and clean – free from oil and dirt – for safe control of the saw.
- Make sure there is sufficient fuel and chain oil in the tanks.

To reduce the risk of personal injury, do not operate your saw if it is damaged or not properly assembled.

Starting the chain saw

Always work on a level surface. Ensure a firm and secure footing. Hold the machine securely – the chain must not touch any objects or the floor – danger of injury due to the rotating saw chain.

Your chain saw is a one-person saw. Do not allow other persons to be in the working area – not even while starting.

Do not start the chain saw if the chain is in a cut.

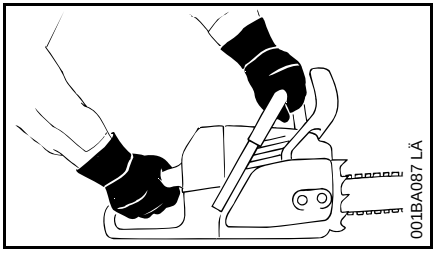
Move at least 3 meters away from the place where the machine was refuelled and never start the motor in enclosed spaces.

Lock the chain with the chain brake before starting – **risk of injury** due to rotating chain!

Do not drop-start the engine – start as described in the Instruction Manual.

During operation

Ensure you always have a firm and safe footing. Take special care when the bark is wet – **danger of slipping!**



Always hold the chain saw **firmly with both hands:** Right hand on the rear handle – even if you are left-handed. To ensure reliable control, wrap your thumbs tightly around the handlebar and handle.

In the event of impending danger or in an emergency, switch off the engine immediately by moving the Master Control lever / stop switch to **STOP**, **0** or ⌽.

Never let the machine run unattended.

Exercise caution with slippery surfaces, water, snow, ice, steep slopes, uneven ground or green wood that has just been stripped of its bark – **danger of slipping!**

Use caution with tree stumps, roots, ditches – **danger of stumbling!**

Do not work alone – keep within calling distance of others who are trained in emergency procedures and can provide help in an emergency. Helpers at the cutting site must also wear protective clothing (helmet!) and stand well clear of the branches being cut.

More care and attention than usual are required when wearing ear protection, as warning sounds (shouts, beeps, etc.) cannot be heard properly.

Take a break in good time to avoid tiredness or exhaustion – **risk of accidents!**

Dust (e. g., sawdust), fumes and smoke produced while using the machine may be hazardous to health. If dust is generated, wear a dust mask.

When the engine is running: Note that the saw chain continues to rotate for a short period after you let go of the throttle trigger – coasting effect.

No smoking when working with or near the chain saw - **risk of fire!** Combustible fuel vapour may escape from the fuel system.

Examine the saw chain periodically at short intervals and as soon as you note any tangible changes:

- Switch off the engine; wait until the saw chain is stationary
- Check condition and secure fitting
- Check sharpness

Never touch the saw chain when the engine is running. If the saw chain becomes jammed by an object, switch off the engine immediately before attempting to remove the object – **risk of injury!**

Always turn off the engine before leaving the machine unattended.

To change the saw chain, switch off the engine. **Risk of injury** from the motor starting unintentionally!

Keep easily combustible materials (e. g., wood chips, bark, dry grass, fuel) away from hot exhaust gases and hot mufflers – **risk of fire!** Mufflers with catalytic converters can become especially hot.

Never work without chain lubrication – monitor the oil level in the oil tank. Stop work immediately if the oil level in the oil tank is too low and top up with chain oil – see also "Topping up with chain oil" and "Check chain lubrication".

If the machine is subjected to unusually high loads for which it was not designed (e. g., heavy impact or a fall), always check that it is in good condition before continuing work – see also "Before starting work".

Check the fuel system for leaks and make sure the safety devices are working properly. Never continue using a machine that is not in perfect working order. In case of doubt, have the unit checked by your servicing dealer.

Check for correct idling, so that the saw chain stops moving when the throttle trigger is released. Check the idle setting regularly and correct when possible. Have the machine repaired by a STIHL servicing dealer if the saw chain still continues to move during idling.

The chain saw produces poisonous exhaust gases as soon as the engine starts. These gases may be colourless and odourless and may contain unburnt hydrocarbons and benzene. Never work with the machine indoors or in poorly ventilated areas, even if your machine is equipped with a catalytic converter.

Ensure proper ventilation when working in trenches, hollows or other confined locations – **risk of fatal injury from breathing toxic fumes!**

If you feel sick, have a headache, vision problems (e. g., your field of vision gets smaller), hearing problems, dizziness or inability to concentrate, stop work immediately. Such symptoms may be caused by an excessively high concentration of exhaust emissions – **risk of accident!**

After finishing work

Switch off the motor, engage the chain brake and attach the chain scabbard.

Storage

When the machine is not in use, it should be stored in such a way that no-one is endangered. Secure the machine against unauthorised use.

Store the machine in a safe, dry room.

Vibrations

Prolonged use of the power tool may result in vibration-induced circulation problems in the hands (whitefinger disease).

No general recommendation can be given for the length of usage because it depends on several factors.

The period of usage is prolonged by:

- Hand protection (wearing warm gloves)
- Work breaks

The period of usage is shortened by:

- Any personal tendency to suffer from poor circulation (symptoms: frequently cold fingers, tingling sensations).
- Low outside temperatures.
- The force with which the handles are held (a tight grip restricts circulation).

Continual and regular users should monitor closely the condition of their hands and fingers. If any of the above symptoms appear (e.g. tingling sensation in fingers), seek medical advice.

Maintenance and repairs

Always switch off the engine before any repair, cleaning or maintenance work and any work on the chain. **Risk of injury** if the engine starts inadvertently!

Exception: adjustment of carburettor and idle speed.

The machine must be serviced regularly. Do not attempt any maintenance or repair work not described in the Instruction Manual. All other work should be carried out by a servicing dealer.

STIHL recommends that maintenance and repair work be carried out only by authorised STIHL dealers. STIHL dealers receive regular training and are supplied with technical information.

Use only high-quality spare parts. Otherwise, there may be a risk of accidents and damage to the machine. If you have any questions in this respect, consult a servicing dealer.

Do not modify the machine in any way – this may increase the risk of personal injury –**risk of accidents!**

To reduce the **risk of fire** due to ignition outside the cylinder, move the master control level to **STOP**, **0** or ⇳ before turning the engine over on the starter when the spark plug boot is removed or the spark plug is unscrewed!

Do not service or store the machine near a naked flame – **risk of fire** due to the fuel.

Check fuel cap regularly for tightness.

Use only spark plugs that are in perfect condition and have been approved by STIHL – see "Specifications".

Check ignition lead (insulation in good condition, secure connection).

Check that the muffler is in perfect working condition.

Do not use the machine if the muffler is damaged or missing – **risk of fire, damage to hearing!**

Never touch a hot muffler – **risk of burns!**

The condition of the anti-vibration elements influences vibration behaviour – inspect anti-vibration elements periodically.

Inspect chain catcher – replace if damaged.

Switch off the engine

- To check the chain tension
- To retension the chain
- To replace the chain
- For remedying malfunctions

Observe sharpening instructions – for safe and proper handling, always keep the chain and guide bar in flawless condition. Keep the chain properly sharpened, tensioned and well lubricated.

Change chain, guide bar and chain sprocket in due time.

Regularly check that the clutch drum is in perfect working condition.

Always store fuel and chain lubricant only in the specified type of containers and ensure they are correctly labelled. Store in a dry, cool and secure place protected against light and sunlight.

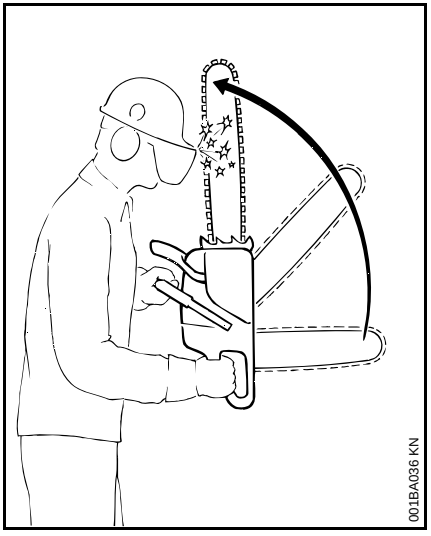
In the event of a chain brake malfunction, switch off the machine immediately – **risk of injury!** Consult a servicing dealer – do not use the machine until the malfunction has been remedied, see "Chain brake".

Reactive Forces

The most common reactive forces are: kickback, pushback and pull-in.

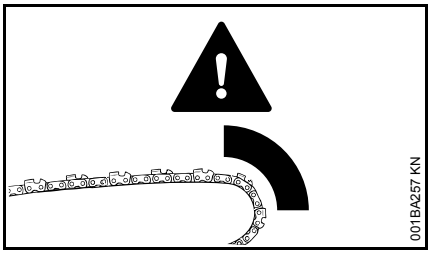
Dangers of kickback

Kickback can result in fatal cuts.



Kickback occurs when the saw is suddenly thrown up and back in an uncontrolled arc towards the operator.

Kickback occurs if, for example,



- The saw chain in the area of the upper quarter of the guide bar nose unintentionally comes into contact with wood or a solid object – e. g., unintentionally touches another limb during limbing
- The saw chain at the nose of the guide bar is briefly pinched in the cut

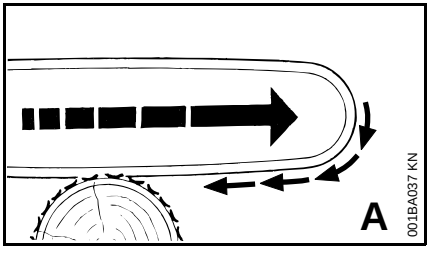
QuickStop chain brake:

This device reduces the risk of injury in certain situations – it cannot prevent kickback. If activated, the brake stops the saw chain within a fraction of a second –
refer to chapter "Chain brake" in this Instruction Manual.

Reducing the risk of kickback

- Work cautiously and methodically
- Hold the chain saw firmly with both hands and maintain a secure grip
- Always cut at full throttle
- Be aware of the location of the guide bar nose
- Do not cut with the guide bar nose
- Be especially careful with small, tough limbs, undergrowth and offshoots – the saw chain may become caught in them
- Never cut several limbs at once
- Do not lean too far forward
- Do not cut above shoulder height
- Use extreme caution when re-entering a previous cut
- Do not attempt plunge cuts if you are not experienced in this cutting technique
- Be alert for shifting of the log or other forces that may cause the cut to close and pinch the chain
- Always cut with a correctly sharpened, properly tensioned saw chain – the depth gauge setting must not be too large
- Use low-kickback saw chains as well as narrow-radius guide bars

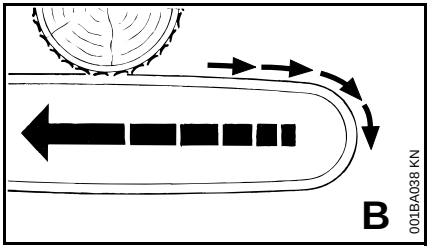
Pull-in (A)



When the chain on the bottom of the bar – overbucking – is suddenly pinched, caught or encounters a foreign object in the wood, the chain saw may suddenly

be drawn forward toward the log – **to avoid this, engage the bumper spike firmly in the wood**.

Pushback (B)



When the chain on the top of the bar – underbucking – is suddenly pinched, caught or encounters a foreign object in the wood, the chain saw may suddenly be driven straight back toward the operator – **to avoid this**:

- Do not allow the top of the guide bar to become jammed
- Do not twist the guide bar in the cut

Be very careful

- With freely hanging limbs
- With trunks that are under tension between other trees because they fell unfavourably
- When working in windbreaks

In these cases, do not use a chain saw – use a hoist, winch or dragline instead.

Pull out trunks that are lying about and have been cut free. Whenever possible, deal with them in open areas.

Dead wood (brittle, rotten or dead wood) poses a significant, highly unpredictable hazard. It is extremely difficult or even practically impossible to recognise the danger. Use aids such as winches or draglines.

When **felling close to roads, rail lines, power lines,** etc., work with particular care. If necessary, notify police, power companies or railway authorities.

Working Techniques

Sawing and felling work, including all related work (plunge cutting, limbing, etc.) may only be carried out by persons who have been specially trained and instructed. Persons who are not experienced chain saw users should not carry out any such work – increased risk of accidents!

Country-specific legislation on felling technique must be complied with during felling work.

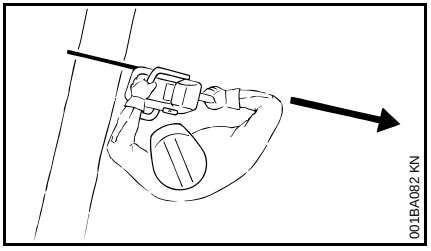
Cutting

Do not operate your saw with the starting throttle lock engaged. Engine speed cannot be controlled with the throttle trigger in this position.

Work calmly and carefully – in daylight conditions and only when visibility is good. Ensure you do not endanger others – stay alert at all times.

First-time users are advised to practice cutting logs on a sawhorse – see "When cutting small logs".

Use the shortest possible guide bar: The chain, guide bar and chain sprocket must match each other and your saw.



Position the saw so that your body is **clear of the cutting attachment**.

Always pull the saw out of the cut with the chain running.

Use your chain saw for cutting only. It is not designed for prying or shoveling away limbs, roots or other objects.

Do not underbuck freely hanging limbs.

Take care when cutting scrub and young trees. The saw chain may catch and throw thin shoots in your direction.

To reduce the risk of injury, take special care when cutting shattered wood because of the risk of injury from slivers being caught and thrown in your direction.

Make sure your saw does not touch any foreign materials: Stones, nails, etc. may be flung off and damage the saw chain. The saw may kick back unexpectedly – **risk of accidents**.

If the rotating chain makes contact with a rock or other solid object there is a risk of sparking which may cause easily combustible material to catch fire under certain circumstances. Dry plants and scrub are also easily combustible, especially in hot and dry weather conditions. If there is a risk of fire, do not use your chainsaw near combustible materials, dry plants or scrub. Always contact your local forest authority for information on a possible fire risk.

If on a slope, stand on the uphill side of the log. Watch out for rolling logs.

When working at heights:

- Always use a lift bucket
- Never work on a ladder or in a tree
- Never work on an insecure support
- Do not work above shoulder height
- Never operate your power tool with one hand

Begin cutting with the saw at full throttle and engage the spiked bumper firmly in the wood, and then continue cutting.

Never work without the spiked bumper because the saw may pull you forwards and off balance. Always engage the spiked bumper securely in the tree or limb.

Note when reaching the end of a cut that the saw is no longer supported in the kerf. You have to take the full weight of the machine since **it might otherwise go out of control**.

When cutting small logs:

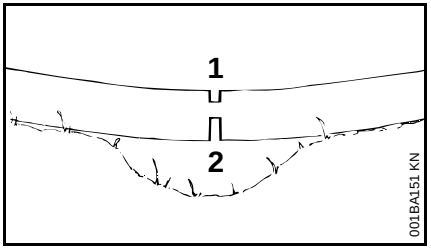
- Use a sturdy and stable support – sawhorse.
- Never hold the log with your leg or foot.
- Never allow another person to hold the log or help in any other way.

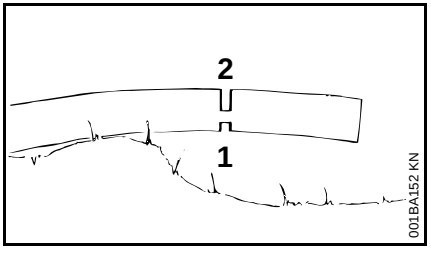
Limbing:

- Use a low kickback chain.
- Work with the saw supported wherever possible.
- Do not stand on the log while limbing it.
- Do not cut with the bar nose.
- Watch for limbs which are under tension.
- Never cut several limbs at once.

Lying or standing logs under tension:

Always make cuts in the correct sequence (first at the compression side (1), then at the tension side (2), the saw may otherwise pinch or kick back – **risk of injury**.





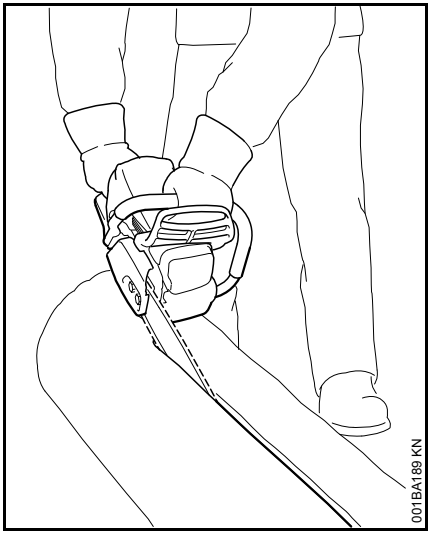
- Make relieving cut at the compression side (1)
- Make bucking cut at the tension side (2)

Be wary of **pushback** when making bucking cut from the bottom upwards (underbuck).

NOTICE

Do not cut a lying log at a point where it is touching the ground because the saw chain will otherwise be damaged.

Ripping cut:

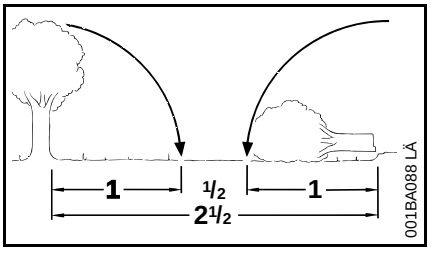


Cutting technique in which the spiked bumper is not used – risk of pull-in – start the cut with the guide bar at the shallowest possible angle – take extra care since there is an increased **danger of kickback**.

Preparations for Felling

Check that there are no other persons in the felling area – other than helpers.

Make sure no-one is endangered by the falling tree – the noise of your engine may drown any warning calls.



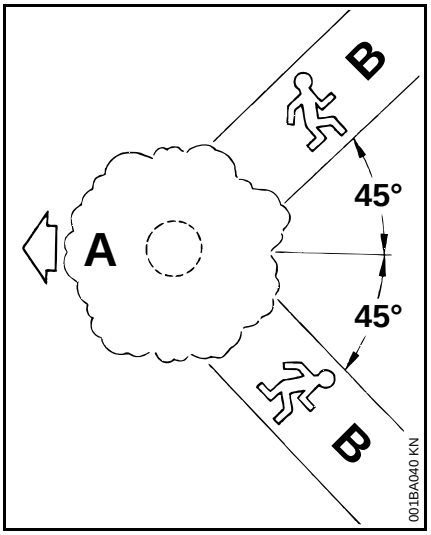
Maintain a distance of at least 2 1/2 tree lengths from the next felling site.

Determine direction of fall and escape path.

Select gap in stand into which you want the tree to fall.

Pay special attention to the following points:

- The natural lean of the tree
- Any unusually heavy limb structure, damage
- The wind direction and speed – do not fell in high winds
- Sloping ground
- Neighboring trees
- Snow load
- Soundness of tree – take special care if trunk is damaged or in case of deadwood (dry, decayed or rotted wood)



A Direction of fall

B Escape path (or retreat path)

– Establish paths of escape for everyone concerned – opposite to direction of fall at about 45°.

– Remove all obstacles from escape paths.

– Place all tools and equipment a safe distance away from the tree, but not on the escape paths.

– Always keep to the side of the falling tree and only walk away along the preplanned escape path.

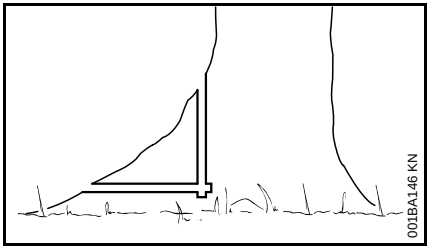
– On steep slopes, plan escape routes parallel to the slope.

– When walking away along the escape path, watch out for falling limbs and watch the top of the tree.

Preparing work area at base of tree

– First clear the tree base and work area from interfering limbs and brush to provide a secure footing.

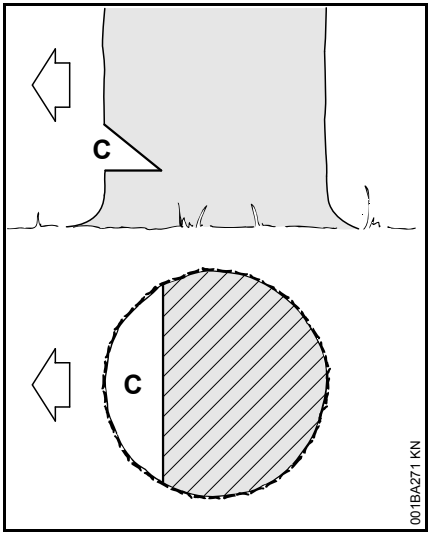
– Clean lower portion of tree base (e.g. with an axe) – sand, stones and other foreign objects will dull the saw chain.



– Make the vertical cut first, then the horizontal – but only if the wood is sound

Felling Notch

Preparing felling notch



The felling notch (C) determines the direction of fall.

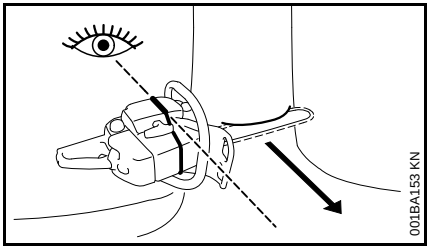
Important:

– Make felling notch at a right angle to the planned direction of fall.

– Cut close to the ground.

– Cut to a depth of about 1/5 to 1/3 of the trunk diameter.

Determine direction of fall with gunning sight on shroud and fan housing



Your chainsaw has a gunning sight on the shroud and fan housing. Use this gunning sight.

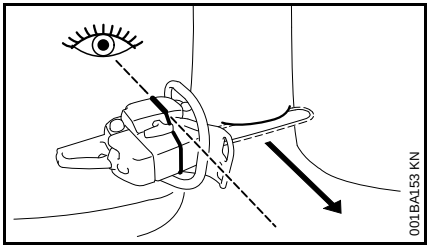
Making Felling Notch

Position the saw so that the felling notch is at a right angle to the direction you want the tree to fall.

The sequence in which the felling notch is made with a horizontal cut (bottom) and angled cut (top) is defined in country-specific regulations.

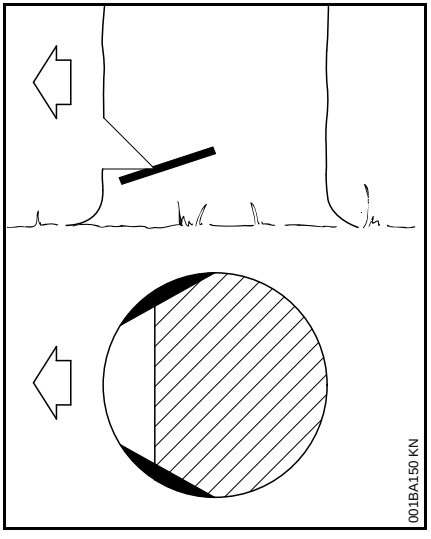
- Make horizontal cut (bottom)
- Make the angled cut (top) at about 45°- 60° to the horizontal cut.

Check direction of fall



- Position the saw in the horizontal cut. The gunning sight must point in the planned direction of fall – if necessary, correct direction of fall by re-cutting the felling notch.

Sapwood cuts

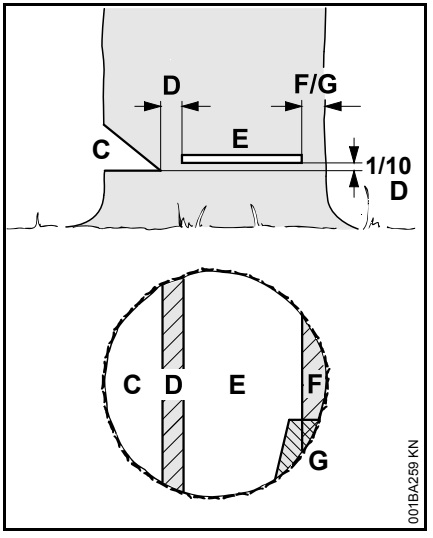


Sapwood cuts in long-fibered softwood help prevent sapwood splintering when the tree falls. Make cuts at both sides of the trunk at same height as bottom of felling notch to a depth of about 1/10 of trunk diameter. On large diameter trees, cut to no more than width of guide bar.

Do not make sapwood cuts if wood is diseased.

Basic Information on Felling Cut

Stump dimensions



The **felling notch** (C) determines the direction of fall.

The **hinge** (D) helps control the falling tree.

- Width of hinge: about 1/10 of tree diameter.
- **To reduce the risk of accidents**, do not cut through the hinge – you could lose control of the direction of fall.
- Leave a broader hinge on rotten trees.

The tree is felled with the **felling cut** (E).

– Cut horizontally.

– 1/10 (at least 3 cm) of width of hinge (D) higher than bottom of felling notch (C).

The **holding strap** (F) or **stabilizing strap** (G) supports the tree and helps prevent it from falling prematurely.

– Width of strap: about 1/10 to 1/5 of tree diameter.

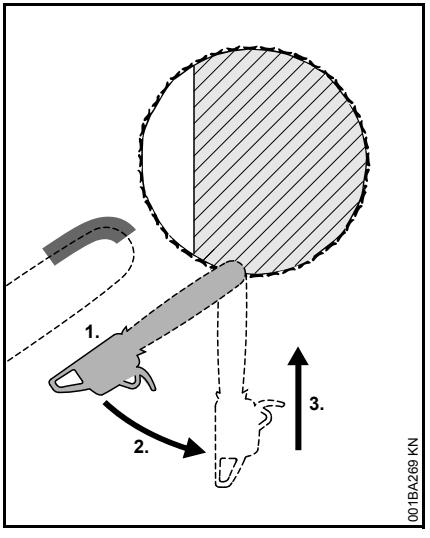
– Do not cut into the strap while making the felling cut.

– Leave a broader strap on rotten trees.

Plunge cutting

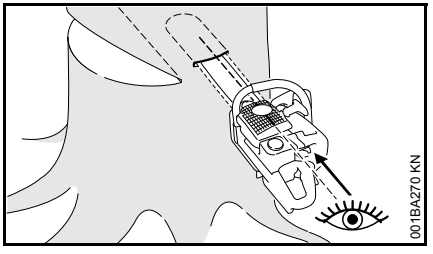
– For relieving cuts during bucking

– For wood carving



- Use a low kickback chain and exercise particular caution

1. Begin cut by applying the lower portion of the guide bar nose – do not use upper portion because of – **risk of kickback.** Start cutting at full throttle until depth of kerf is twice the width of the guide bar.
2. Swing saw slowly into plunge-cutting position – take care because of the **risk of kickback or pushback.**
3. Make the plunge cut very carefully. **Danger of pushback.**



Use the plunge-cutting sight if possible. The plunge-cutting sight and the top and bottom of the guide bar are parallel.

When making the plunge cut, the sight helps keep the hinge horizontal, i.e. the same thickness all round. To do this, hold the plunge-cutting sight parallel to the chord of the felling notch.

Felling wedges

Make use of wedges as soon as possible, i.e. providing they do not interfere with cutting. Drive wedge into felling cut with a suitable tool.

Use only aluminum or plastic wedges – never steel. Steel wedges can seriously damage the saw chain and cause dangerous kickback.

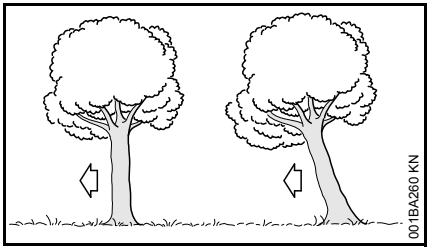
Select felling wedges that suit the diameter of the tree and width of the kerf (felling cut (E)).

Contact your STIHL dealer for advice on selecting the right felling wedge (length, width and height).

Choosing Right Felling Cut

The criteria for choosing the right felling cut are the same as those for determining the direction of fall and the escape path.

There are many different variations of these characteristics. Only the two most common characteristics are described in this manual:

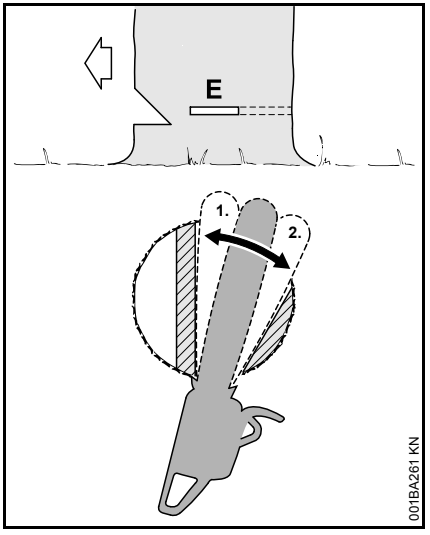


Left:	Normal tree – vertical trunk with uniform tree crown.
Right:	Leaner – tree crown leans in direction of fall.

Felling Cut with Stabilizing Strap (Normal Tree)

A) Small diameter trees

Perform this felling cut when the tree diameter is smaller than the length of the guide bar.



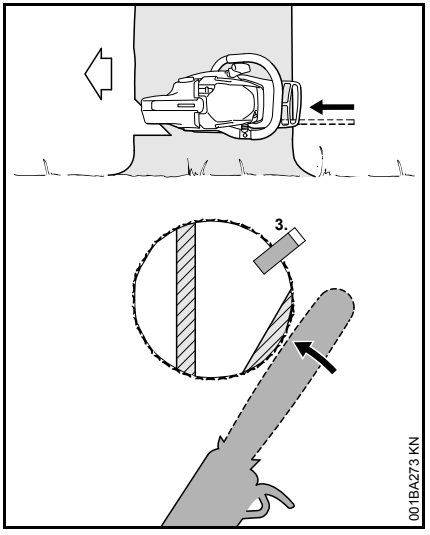
Shout a warning before starting the felling cut.

- Start felling cut (E) using plunge-cut method – insert full length of guide bar in the trunk.
- Engage the spiked bumper behind the hinge and use it as a pivot – avoid repositioning the saw more than necessary.
- Enlarge felling cut as far as hinge (1).

– Do not cut into the hinge.

- Enlarge felling cut as far as stabilizing strap (2).

– Do not cut into the stabilizing strap.



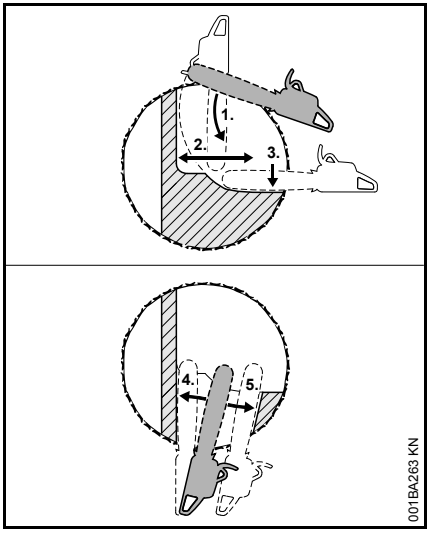
- Insert a felling wedge (3).

Shout a second warning immediately before the tree falls.

- Holding the saw with outstretched arms, cut through the stabilizing strap horizontally at the same level as the felling cut.

B) Large diameter trees

Perform this felling cut when the tree diameter is greater than the length of the guide bar.



Shout a warning before starting the felling cut.

- Engage the spiked bumper at the required height of the felling cut and use it as a pivot – avoid repositioning the saw more than necessary.
- The guide bar nose enters the wood (1) before it reaches the hinge – hold the saw horizontally and swing it as far as possible.
- Enlarge felling cut as far as hinge (2).

– Do not cut into the hinge.

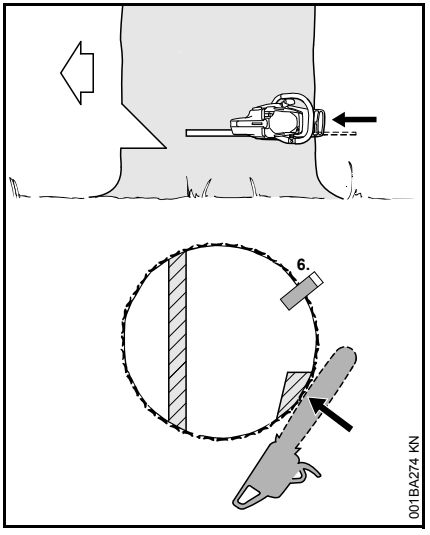
- Enlarge felling cut as far as stabilizing strap (3).

– Do not cut into the stabilizing strap.

Continue the felling cut on the other side of the trunk.

Make sure the second cut is at the same height as the first cut.

- Start felling cut using plunge-cut method.
- Enlarge felling cut as far as hinge (4).
- – Do not cut into the hinge.
- Enlarge felling cut as far as stabilizing strap (5).
- – Do not cut into the stabilizing strap.



- Insert a felling wedge (6).

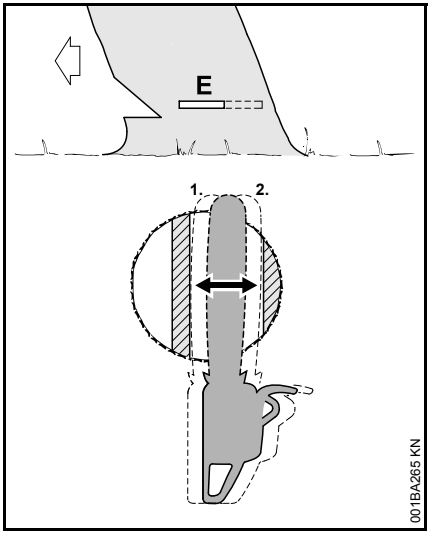
Shout a second warning immediately before the tree falls.

- Holding the saw with outstretched arms, cut through the stabilizing strap horizontally at the same level as the felling cut.

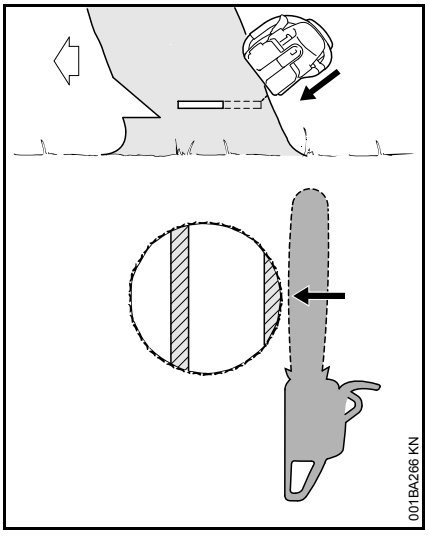
Felling Cut with Holding Strap (Leaner)

A) Small diameter trees

Perform this felling cut when the tree diameter is smaller than the length of the guide bar.



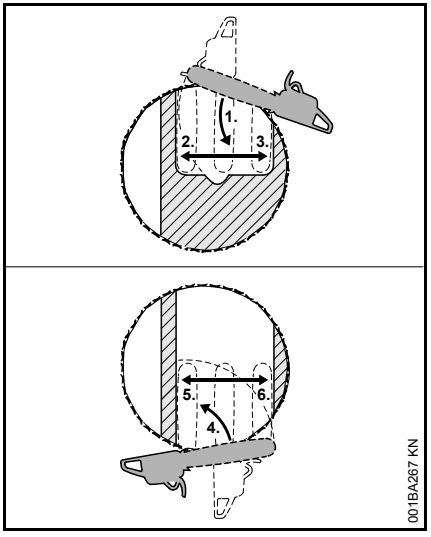
- Plunge the guide bar into the trunk until it emerges at the other side.
- Enlarge the felling cut (E) in direction of hinge (1).
- – Cut horizontally.
- – Do not cut into the hinge.
- Enlarge the felling cut in direction of holding strap (2).
- – Cut horizontally.
- – Do not cut into the holding strap.



Shout a second warning immediately before the tree falls.

- Cut through the holding strap at a downward angle from outside with outstretched arms.

B) Large diameter trees



Perform this felling cut when the tree diameter is greater than the length of the guide bar.

- Engage the spiked bumper behind the holding strap and use it as a pivot – avoid repositioning the saw more than necessary.
- The guide bar nose enters the wood (1) before it reaches the hinge – hold the saw horizontally and swing it as far as possible.

– Do not cut into the holding strap or hinge.

- Enlarge felling cut as far as hinge (2).

– Do not cut into the hinge.

- Enlarge felling cut as far as holding strap (3).

– Do not cut into the holding strap.

Continue the felling cut on the other side of the trunk.

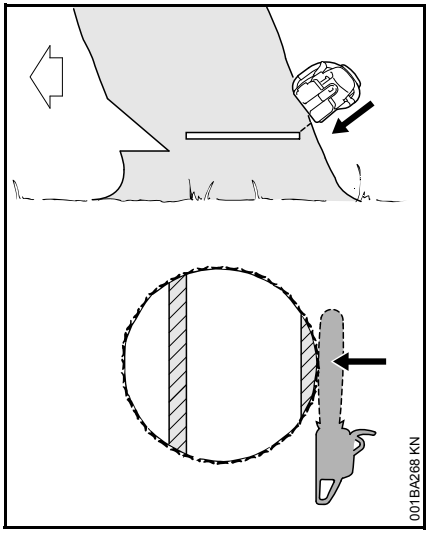
Make sure the second cut is at the same height as the first cut.

- Engage the spiked bumper behind the hinge and use it as a pivot – avoid repositioning the saw more than necessary.
- The guide bar nose enters the wood (4) before it reaches the holding strap – hold the saw horizontally and swing it as far as possible.
- Enlarge felling cut as far as hinge (5).

– Do not cut into the hinge.

- Enlarge felling cut as far as holding strap (6).

– Do not cut into the holding strap.



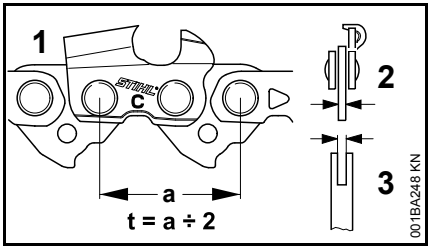
Shout a second warning immediately before the tree falls.

- Cut through the holding strap at a downward angle from outside with outstretched arms.

Cutting Attachment

A cutting attachment consists of the saw chain, guide bar and chain sprocket.

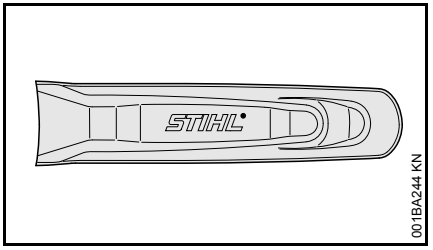
The cutting attachment that comes standard is designed to exactly match the chain saw.



– The pitch (t) of the saw chain (1), chain sprocket and the nose sprocket of the Rollomatic guide bar must match.
– The drive link gauge (2) of the saw chain (1) must match the groove width of the guide bar (3).

If non-matching components are used, the cutting attachment may be damaged beyond repair after a short period of operation.

Chain Scabbard



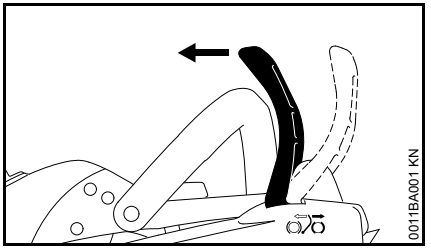
Your saw comes standard with a chain scabbard that matches the cutting attachment.

If guide bars of different lengths are mounted to the saw, always use a chain scabbard of the correct length which covers the complete guide bar.

The length of the matching guide bars is marked on the side of the chain scabbard.

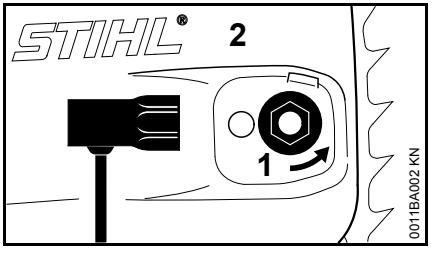
Mounting the Bar and Chain

Releasing the chain brake



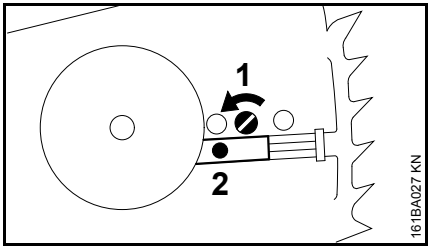
- Pull hand guard towards the front handle until it engages audibly – chain brake is released

Removing the chain sprocket cover

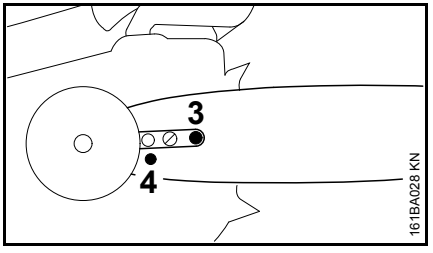


- Turn the captive nut (1) to the left until it hangs loosely in the chain sprocket cover
- Remove the chain sprocket cover (2) with captive nut

Fitting the guide bar



- Turn screw (1) to the left until the tensioner slide (2) butts against the left end of the housing slot

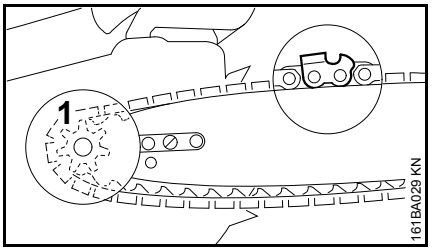


- Fit the guide bar over the screw (3) and engage the peg of the tensioner slide in the locating hole (4)

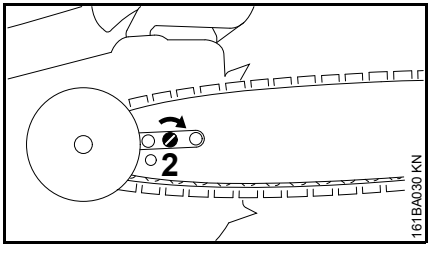
Fitting the saw chain

WARNING

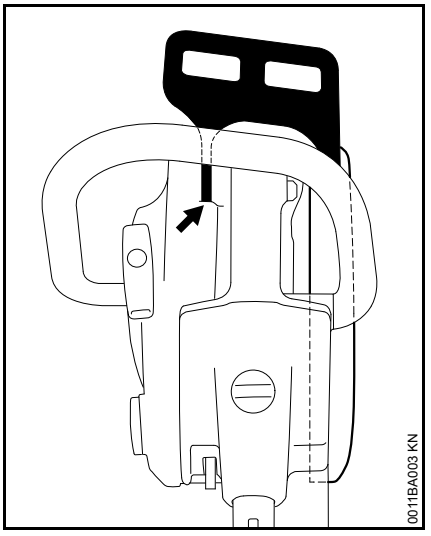
Put on protective gloves – risk of injury by the sharp cutters!



- Fit saw chain around the sprocket wheel (1) and over the guide bar – the cutting edges of the teeth must point to the right

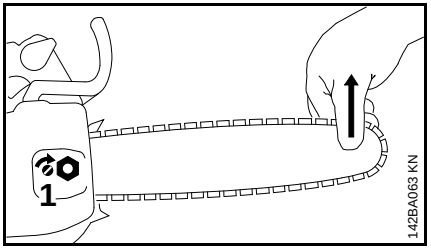


- Turn screw (2) to the right until there is very little chain sag on the underside of the bar – and the drive link tangs engage in the bar groove



- Refit the chain sprocket cover – the pivot pin on the hand guard must engage in the sleeve – and then screw on the nut by hand until it is fingertight
- Go to chapter "Tensioning the Saw Chain"

Tensioning the Saw Chain (side chain tensioner)



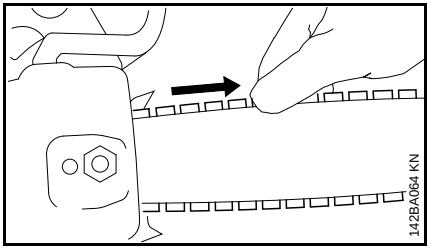
Retensioning during cutting work:

- Switch off the engine.
- Loosen the nut.
- Hold the bar nose up.
- Use a screwdriver to turn the tensioning screw (1) clockwise until the chain fits snugly against the underside of the bar.
- While still holding the bar nose up, tighten down the nut firmly.
- Go to "Checking Chain Tension".

A new chain has to be retensioned more often than one that has been in use for some time.

- Check chain tension frequently – see chapter on "Operating Instructions".

Checking Chain Tension



- Shut off the engine.
- Wear work gloves to protect your hands.
- The chain must fit snugly against the underside of the bar and it must still be possible to pull the chain along the bar by hand when the chain brake is released.
- If necessary, retension the chain.

A new chain has to be retensioned more often than one that has been in use for some time.

- Check chain tension frequently – see chapter on "Operating Instructions".

Fuel

Your engine requires a mixture of gasoline and engine oil.

WARNING

For health reasons, avoid direct skin contact with gasoline and avoid inhaling gasoline vapor.

STIHL MotoMix

STIHL recommends the use of STIHL MotoMix. This ready-to-use fuel mix contains no benzol or lead, has a high octane rating and ensures that you always use the right mix ratio.

STIHL MotoMix uses STIHL HP Ultra two-stroke engine oil for an extra long engine life.

MotoMix is not available in all markets.

Mixing Fuel

NOTICE

Unsuitable fuels or lubricants or mix ratios other than those specified may result in serious damage to the engine. Poor quality gasoline or engine oil may damage the engine, sealing rings, hoses and the fuel tank.

Gasoline

Use only high-quality **brand-name** gasoline with a minimum octane rating of 90 – leaded or unleaded.

If your machine is equipped with a catalytic converter, you must use unleaded gasoline.

NOTICE

A few tankfuls of leaded gasoline will greatly reduce the efficiency of the catalytic converter.

Gasoline with an ethanol content of more than 10% can cause running problems in engines with a manually adjustable carburetor and should not be used in such engines.

Engines equipped with M-Tronic deliver full power when run on gasoline with an ethanol content of up to 25% (E25).

Engine oil

Use only high-quality two-stroke engine oil – preferably **STIHL HP, HP Super or HP Ultra, which are specially formulated for use in STIHL engines. HP Ultra guarantees high performance and a long engine life.**

These engine oils are not available in all markets.

Use only **STIHL 50:1 two-stroke engine oil** for the fuel mix in models with a catalytic converter.

Mix Ratio

STIHL 50:1 two-stroke engine oil: 50 parts gasoline to 1 part oil

Examples

Gasoline	STIHL engine oil 50:1	
Liters	Liters	(ml)
1	0.02	(20)
5	0.10	(100)
10	0.20	(200)
15	0.30	(300)
20	0.40	(400)
25	0.50	(500)

- Use a canister approved for storing fuel. Pour oil into canister first, then add gasoline and mix thoroughly.

Storing Fuel

Store fuel only in approved safety-type fuel canisters in a dry, cool and safe location protected from light and the sun.

Fuel mix ages – only mix sufficient fuel for a few weeks work. Do not store fuel mix for longer than 30 days. Exposure to light, the sun, low or high temperatures can quickly make the fuel mix unusable.

STIHL MotoMix may be stored for up to 2 years without any problems.

- Thoroughly shake the mixture in the canister before fueling your machine.

WARNING

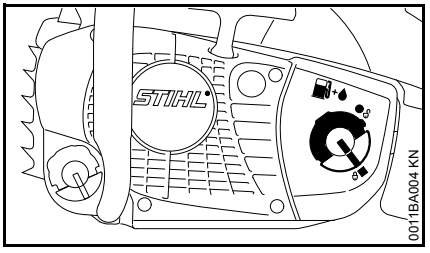
Pressure may build up in the canister – open it carefully.

- Clean the fuel tank and canister from time to time.

Dispose of remaining fuel and cleaning fluid properly in accordance with local regulations and environmental requirements.

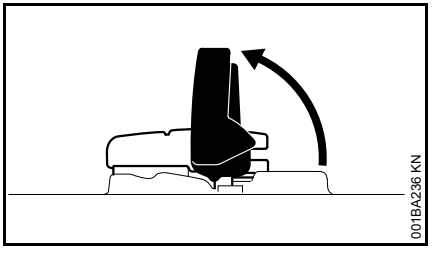
Fueling

Preparing the machine

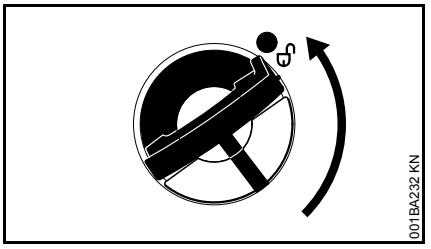


- Before fueling, clean the filler cap and the area around it so that dirt cannot fall into the fuel tank
- Always position the machine so that the filler cap is facing upwards

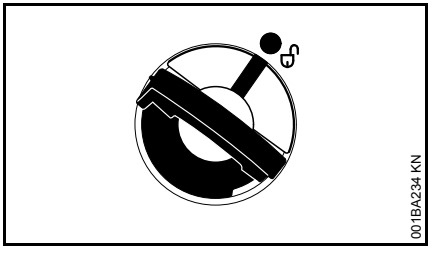
Opening



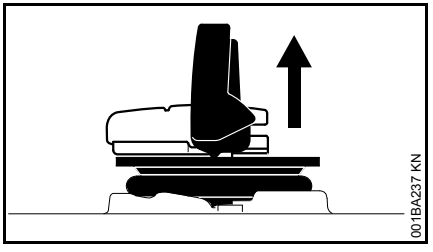
- Raise the grip until it is upright.



- Turn the cap counterclockwise (about a quarter turn).



Marks on tank cap and fuel tank must line up.



- Remove the cap.

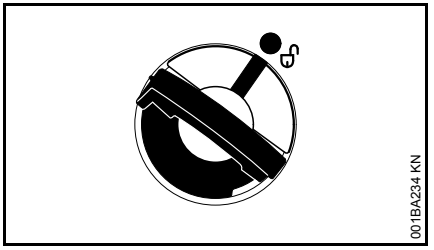
Filling up with fuel

Take care not to spill fuel while fueling and do not overfill the tank.

STIHL recommends you use the STIHL filler nozzle for fuel (special accessory).

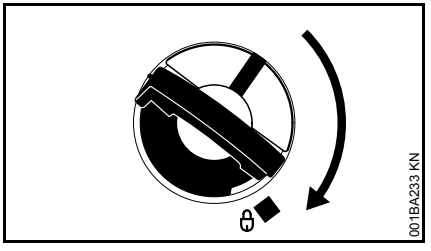
- Fill up with fuel.

Closing

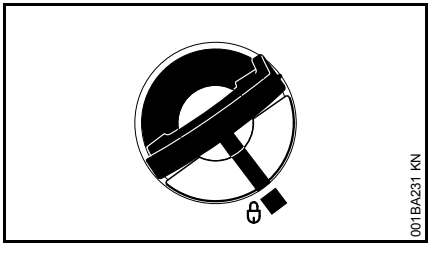


Grip must be vertical:

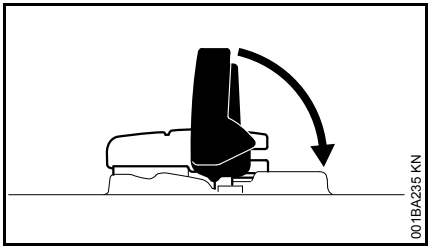
- Fit the cap – marks on tank cap and fuel tank must line up.
- Press the cap down as far as stop.



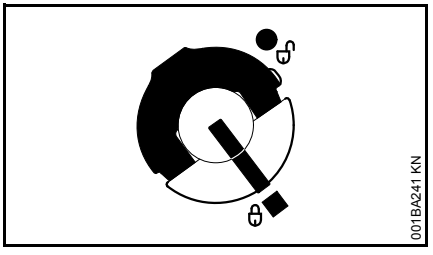
- While holding the cap depressed, turn it clockwise until it engages in position.



The marks on the tank cap and fuel tank are then in alignment.



- Fold the grip down so that it is flush with the top of the cap.

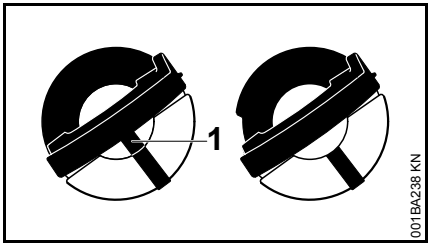


Tank cap is locked.

If the tank cap cannot be locked in the fuel tank opening

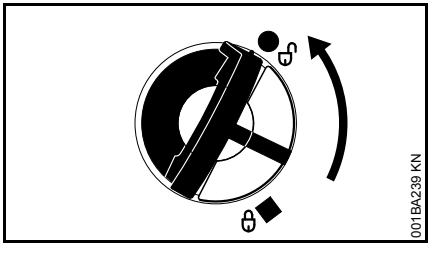
Bottom of cap is twisted in relation to top.

- Remove the cap from the fuel tank and check it from above.



Left: Bottom of cap is twisted – inner mark (1) in line with outer mark.

Right: Bottom of cap in correct position – inner mark is under the grip. It is not in line with the outer mark.



- Place the cap on the opening and rotate it counterclockwise until it engages the filler neck.
- Continue rotating the cap counterclockwise (about a quarter turn) – this causes the bottom of the cap to be turned to the correct position.
- Turn the cap clockwise and lock it in position – see section on "Closing".

Chain Lubricant

For automatic and reliable lubrication of the chain and guide bar – use only an environmentally compatible quality chain and bar lubricant. Rapidly biodegradable STIHL BioPlus is recommended.

NOTICE

Biological chain oil must be resistant to aging (e.g. STIHL BioPlus), since it will otherwise quickly turn to resin. This results in hard deposits that are difficult to remove, especially in the area of the chain drive and chain. It may even cause the oil pump to seize.

The service life of the chain and guide bar depends on the quality of the lubricant. It is therefore essential to use only a specially formulated chain lubricant.

WARNING

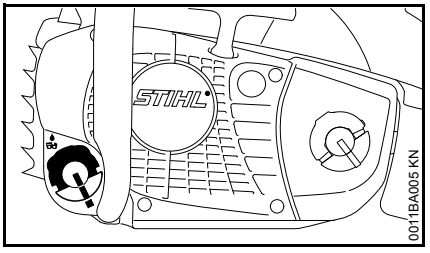
Do not use waste oil. Renewed contact with waste oil can cause skin cancer. Moreover, waste oil is environmentally harmful.

NOTICE

Waste oil does not have the necessary lubricating properties and is unsuitable for chain lubrication.

Filling Chain Oil Tank

Preparing the machine



- Thoroughly clean the filler cap and the area around it to ensure that no dirt falls into the tank
- Always position the machine so that the filler cap is facing upwards
- Open the filler cap

Filling Chain Oil Tank

- Refill the chain oil tank every time you refuel

Take care not to spill chain oil during refilling and do not overfill the tank.

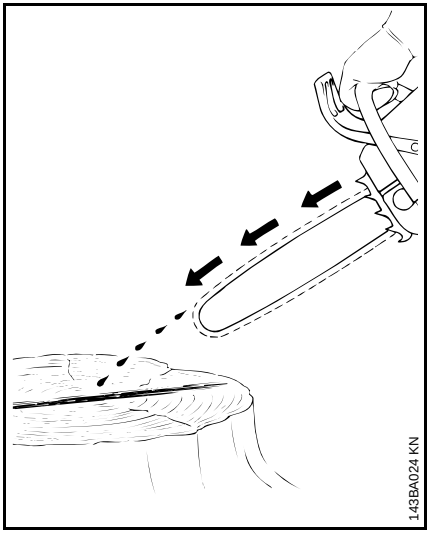
STIHL recommends use of the STIHL filling system for chain oil (special accessory).

- Close the filler cap

There must still be a small amount of chain oil in the oil tank when the fuel tank is empty.

If the oil tank is still partly full, the reason may be a problem in the oil supply system: Check chain lubrication, clean the oil passages, contact your servicing dealer for assistance if necessary. STIHL recommends that maintenance and repair work be carried out only by authorized STIHL dealers.

Checking Chain Lubrication



The saw chain must always throw off a small amount of oil.

NOTICE

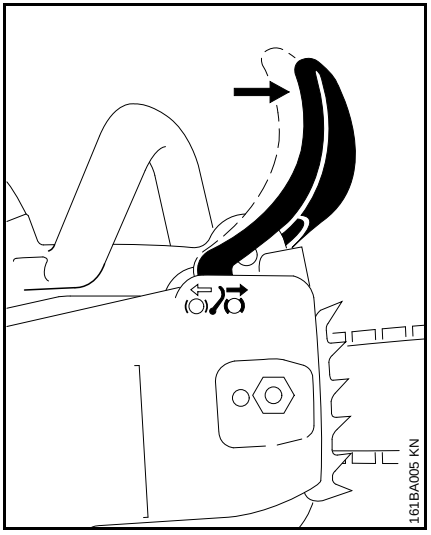
Never operate your saw without chain lubrication. If the chain runs dry, the whole cutting attachment will be irretrievably damaged within a very short time. Always check chain lubrication and the oil level in the tank before starting work.

Every new chain has to be broken in for about 2 to 3 minutes.

After breaking in the chain, check chain tension and adjust if necessary – see "Checking Chain Tension".

Chain Brake

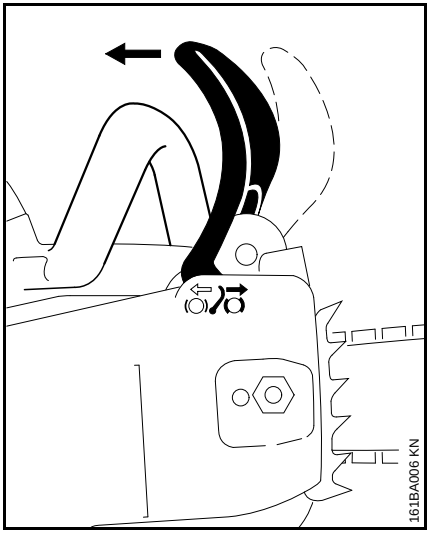
Blocking the chain



– in an emergency
– when starting
– when idling

Press the hand guard towards the nose of the guide bar with the left hand - or automatically due to kickback: the saw chain is blocked - and stops running.

Release the chain brake



- Pull the hand guard toward the handlebar

NOTICE

The chain brake must be released before opening the throttle (except during functional checkout) and before sawing.

Running the engine at high revs with the chain brake engaged (chain locked) will quickly damage the shortblock and chain drive (clutch, chain brake).

The chain brake is activated automatically by a sufficiently strong kickback – due to the mass inertia of the hand guard: The hand guard shoots forward toward the nose of the guide bar – even if the left hand is not on the handlebar behind the hand guard, for example, when making a felling cut.

The chain brake functions only if the hand guard has not been modified in any way.

Checking the chain brake for proper functioning

Each time before starting work: Block the chain while the engine is idling (hand guard towards the nose of the guide bar) and accelerate the engine up to full throttle briefly (3 sec. max.) – the saw chain must not rotate. The hand guard must be free of dirt and easily moveable.

Servicing the chain brake

The chain brake is subject to wear due to friction (normal wear). In order for it to fulfill its function, it must be serviced and maintained periodically by trained personnel. STIHL recommends that maintenance and repair work be carried out only by authorized STIHL dealers.

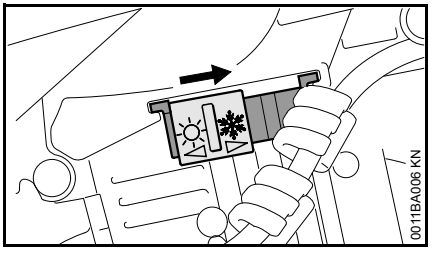
The following intervals must be complied with:

Full-time use:	quarterly
Part-time use:	every six months
Occasional use:	yearly

Winter Operation

At temperatures below +10 °C

- Remove chain sprocket cover – see "Mounting the bar and chain"



- Set shutter to "winter operation"

In the "winter operation" setting, heated air is drawn in from around the cylinder and mixed with cold air. This prevents air filter and carburetor icing.

At temperatures above +20 °C

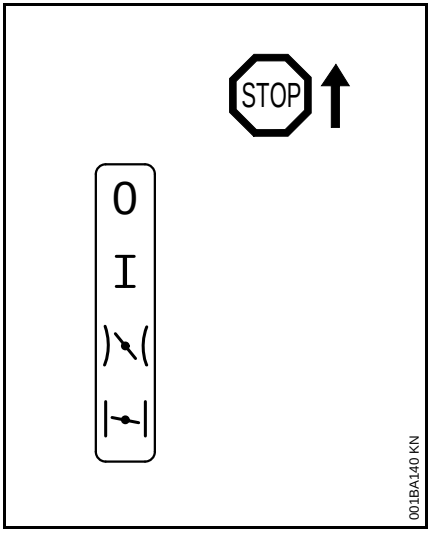
- Always return the shutter to the position for "summer operation"

NOTICE

Risk of engine malfunction – overheating!

Starting / Stopping the Engine

Positions of Master Control Lever



Stop 0 – engine off – the ignition is switched off

Normal run position (I) – engine runs or can fire.

Starting throttle ( ) – this position is used to start a warm engine. The Master Control lever moves to the normal run position as soon as the throttle trigger is squeezed.

Choke shutter closed ( ) – this position is used to start a cold engine.

Setting the Master Control Lever

To move the Master Control lever from the normal run position (I) to choke closed ( ), press down the throttle trigger lockout and squeeze the throttle trigger at the same time and hold them in that position – now set the Master Control lever.

To select the starting throttle position ( ), move the Master Control lever to choke closed ( ) first, then push it into the starting throttle position ( ).

The Master Control lever must be in the choke closed position ( ) for the changeover to the starting throttle position ( ).

The Master Control lever moves from the starting throttle position ( ) to the run position (I) when you press down the throttle trigger lockout and blip the throttle trigger at the same time.

To switch off the engine, move the Master Control lever to Stop (**0**).

Choke shutter closed ( )

- if the engine is cold
- If the engine stalls when you open the throttle after starting.
- If the fuel tank was run until empty (engine stopped).

Starting throttle position ( )

- If the engine is warm, i.e. if it has been running for about one minute.
- After engine begins to fire,
- after clearing a flooded combustion chamber.

Version with ErgoStart

Press the manual fuel pump bulb several times – even if the bulb is already filled with fuel:

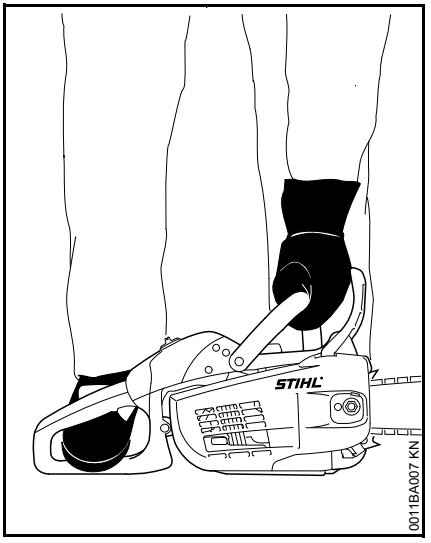
– When starting for the first time.

– If the fuel tank was run until empty (engine stopped).

Holding the Saw

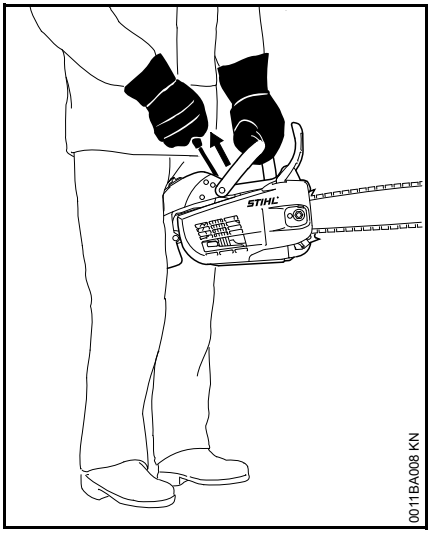
There are two ways of holding the saw when starting.

On the ground



- Place your saw on the ground. Make sure you have a firm footing – check that the chain is not touching any object or the ground.
- Hold the saw firmly on the ground with your left hand on the front handle – your thumb should be under the handle.
- Put your right foot into the rear handle and press down.

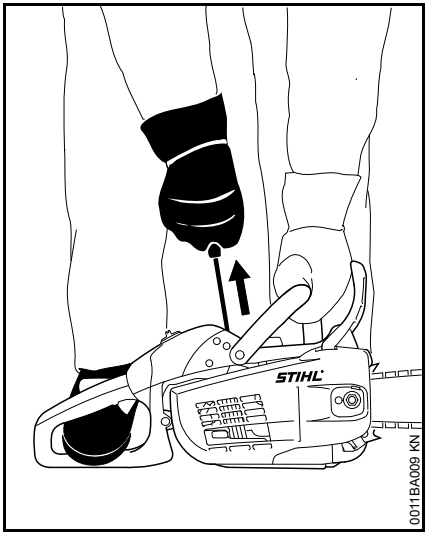
Between knees or thighs



- Hold the rear handle tightly between your legs, just above the knees.
- Hold the front handle firmly with your left hand – your thumb should be under the handle.

Cranking

Standard Version



- Pull the starter grip slowly with your right hand until you feel it engage – and then give it a brisk strong pull and push down the front handle at the same time. Do not pull out the starter rope to full length – **it might otherwise break**. Do not let the starter grip snap back. Guide it slowly back into the housing so that the starter rope can rewind properly.

Machines without additional manual fuel pump: If the engine is new or after a long out-of-service period, it may be necessary to pull the starter rope several times to prime the fuel system.

Version with ErgoStart

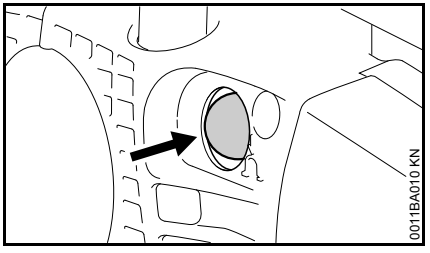
- Pull the starter grip slowly and steadily with your right hand and push down the front handle at the same time. Do not pull out the starter rope all the way – **it might otherwise break**.
- Do not let the starter grip snap back. Guide it slowly back into the housing so that the starter rope can rewind properly.

Starting the Saw

WARNING

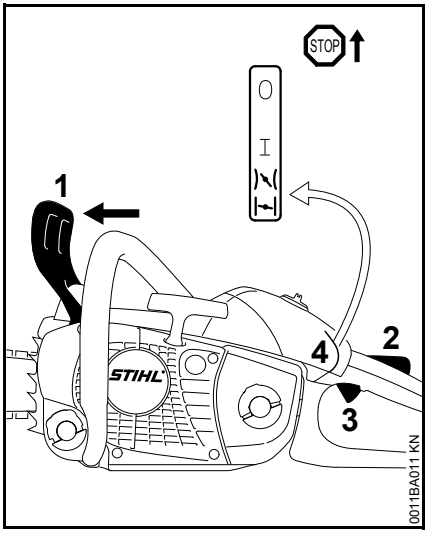
Bystanders must be well clear of the general work area of the saw.

Version with ErgoStart



- Press the manual fuel pump bulb at least five times – even if the bulb is already filled with fuel.

All models



- Push the hand guard (1) forward – the chain is locked.
- Press down the trigger lockout (2) and pull the throttle trigger (3) at the same time. Set Master Control lever (4) to:

Choke shutter closed (⊢◝⊣)

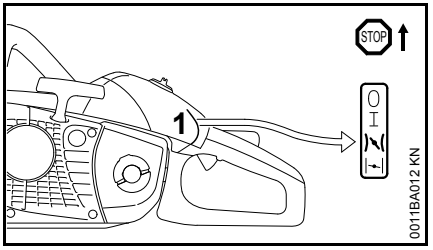
– If the engine is cold (also use this position if the engine stopped when you opened the throttle after starting)

Starting throttle position (⊢◝⊣)

– If the engine is warm, i.e. if it has been running for about one minute.

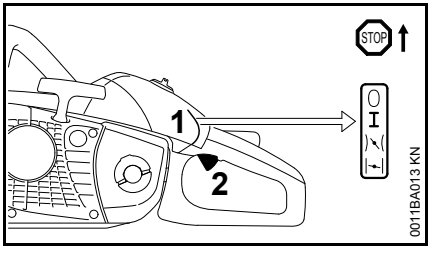
- Hold and start your saw as described.

When engine begins to fire

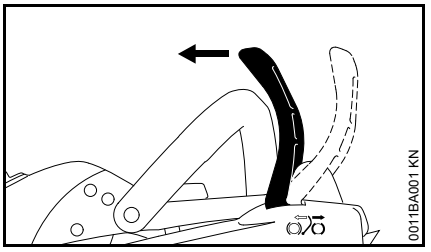


- Move the Master Control lever (1) to the starting throttle position (⎍).
- Hold and start your saw as described.

As soon as the engine runs



- Press down trigger lockout and the blip the throttle trigger (2) – the Master Control lever (1) moves to the run position (I) and the engine settles down to idling speed.



- Pull the hand guard back toward the front handle.

The chain brake is now disengaged – your saw is ready for operation.

NOTICE

Always disengage chain brake before accelerating the engine. High revs with the chain brake engaged (chain locked) will quickly damage the clutch and chain brake.

At very low outside temperatures

- Allow engine to warm up at part throttle.
- Change over to winter operation if necessary – see “Winter Operation”.

Shut off the engine.

- Move the Master Control lever to the stop position (**0**).

If you have moved the Master Control lever from the starting throttle position (⎍) to the stop position (**0**) – depress the trigger lockout and throttle trigger at the same time.

If engine does not start

If you did not move the Master Control lever from the choke closed position (⎌) to the starting throttle position (⎍) quickly enough after the engine began to fire, the combustion chamber may be flooded.

- Move the Master Control lever to the stop position (**0**).
- Remove the spark plug – see "Spark Plug".
- Dry the spark plug.
- Crank the engine several times with the starter to clear the combustion chamber.
- Refit the spark plug – see "Spark Plug".
- Set Master Control lever to the starting throttle position (⎍) – even if the engine is cold.
- Now start the engine.

If Fuel Tank Has Been Run Completely Dry and Then Refueled

- Pull the starter rope several times to prime the fuel system.
- Now start the engine.

Operating Instructions

During the break-in period

A factory new machine should not be run at high revs (full throttle off load) for the first three tank fillings. This avoids unnecessarily high loads during the break-in period. As all moving parts have to bed in during the break-in period, the frictional resistances in the shortblock are greater during this period. The engine develops its maximum power after about 5 to 15 tank fillings.

During work

 NOTICE

Do not make the mixture leaner to achieve an apparent increase in power – this could damage the engine – see "Adjusting the Carburetor".

 NOTICE

Open the throttle only when the chain brake is off. Running the engine at high revs with the chain brake engaged (chain locked) will quickly damage the shortblock and chain drive (clutch, chain brake).

Check chain tension frequently

A new saw chain must be retensioned more frequently than one that has been in use already for an extended period.

Chain cold

Tension is correct when the chain fits snugly against the underside of the bar but can still be pulled along the bar by hand. Retension if necessary – see "Tensioning the Saw Chain".

Chain at operating temperature

The chain stretches and begins to sag. The drive links must not come out of the bar groove on the underside of the bar – the chain may otherwise jump off the bar. Retension the chain – see "Tensioning the Saw Chain".

 NOTICE

The chain contracts as it cools down. If it is not slackened off, it can damage the crankshaft and bearings.

After a long period of full-throttle operation

After a long period of full-throttle operation, allow engine to run for a while at idle speed so that the heat in the engine can be dissipated by flow of cooling air. This protects engine-mounted components (ignition, carburetor) from thermal overload.

After finishing work

- Slacken off the chain if you have retensioned it at operating temperature during work.

 NOTICE

Always slacken off the chain again after finishing work. The chain contracts as it cools down. If it is not slackened off, it can damage the crankshaft and bearings.

Short-term storage

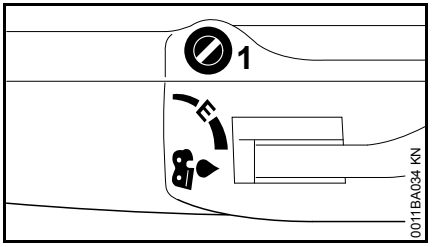
Wait for engine to cool down. Keep the machine with a full tank of fuel in a dry place, well away from sources of ignition, until you need it again.

Long-term storage

See "Storing the machine"

Oil Quantity Control

Varying cutting lengths, types of wood and work techniques require varying amounts of oil.



The oil flow can be adjusted as needed using the adjusting screw (1) on the top of the machine.

Ematic position (E), medium oil flow –

- Turn adjusting screw to "E" (Ematic position)

To increase oil flow –

- turn the adjusting screw clockwise

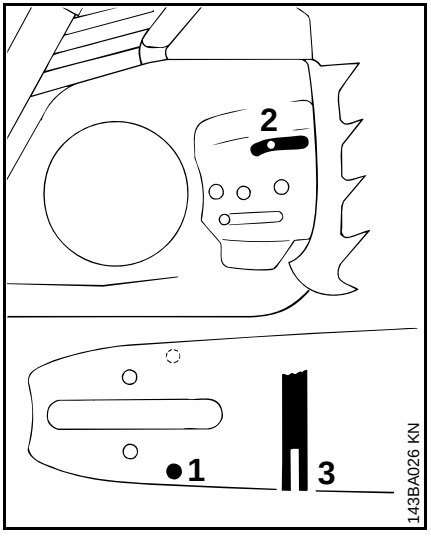
To reduce oil flow –

- turn the adjusting screw counterclockwise

NOTICE

The chain must always be coated with oil.

Taking Care of the Guide Bar



- Flip the bar – after each sharpening and each time the chain is changed – to avoid uneven wear, especially at the sprocket nose and on the bottom
- Periodically clean the oil inlet hole (1), oil outlet channel (2) and bar groove (3)
- Measure groove depth – using the measuring tool on the file gauge (special accessory) – in the area with the greatest wear

Chain type	Chain pitch	Minimum groove depth
Picco	1/4“ P	4.0 mm
Rapid	1/4“	4.0 mm
Picco	3/8“ P	5.0 mm
Rapid	3/8“; 0.325“	6.0 mm
Rapid	0.404“	7.0 mm

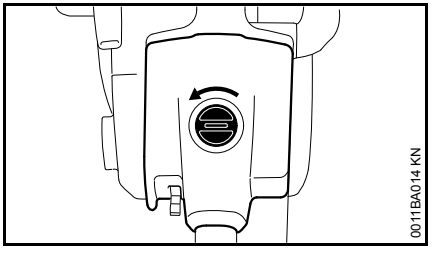
If the groove is not at least this deep:

- Replace guide bar

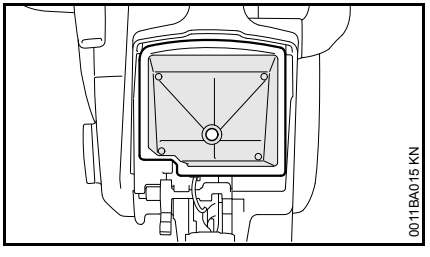
Otherwise the drive links will grind against the base of the groove – the bottoms of the cutters and the tie straps will not lie against the bar.

Cleaning the Air Filter

If there is a noticeable loss of engine power



- Turn cap 90° to the left
- Lift off the shroud



- Lift off the air filter
- Wash the filter with STIHL special-purpose cleaner (special accessories) or a clean, non-flammable cleaning liquid (e.g., warm soapy water) and dry it

NOTICE

Do not clean fleece filters (depending on version) with a brush.

Always replace a damaged filter.

Adjusting the Carburetor

General Information

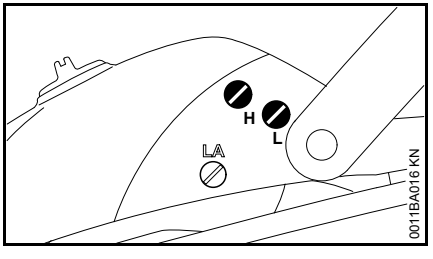
The carburetor comes from the factory with a standard setting.

This setting provides an optimum fuel-air mixture under most operating conditions.

Preparations

- Shut off the engine.
- Check the air filter and clean or replace if necessary.
- Check the spark arresting screen (not in all models, country-specific) in the muffler and clean or replace if necessary.

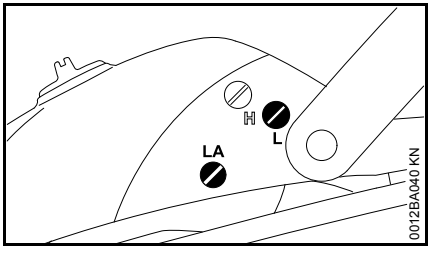
Standard Setting



- Turn high speed screw (H) counterclockwise as far as stop (no more than 3/4 turn).
- Turn the low speed screw (L) clockwise as far as stop, then turn it back 1/4 turn.

Adjusting Idle Speed

- Carry out the standard setting.
- Start and warm up the engine.



Engine stops while idling

- Turn the idle speed screw (LA) clockwise until the chain begins to run – then back it off 1 1/2 turns.

Saw chain runs while engine is idling

- Run engine for 30 seconds at idle speed before making adjustment.
- Turn the idle speed screw (LA) counterclockwise until the chain stops running – then turn it another 1 1/2 turns in the same direction.

WARNING

If the chain continues moving when the engine is idling, have your saw checked and repaired by your servicing dealer.

Erratic idling behavior, poor acceleration (even though standard setting of low speed screw is correct)

- Run engine for 30 seconds at idle speed before making adjustment.

Idle setting is too lean

- Turn the low speed screw (L) carefully counterclockwise, no further than stop, until the engine runs smoothly and accelerates well.

It is usually necessary to change the setting of the idle speed screw (LA) after every correction to the low speed screw (L).

Fine Tuning for Operation at High Altitude

A slight correction of the setting may be necessary if the engine does not run satisfactorily:

- Carry out the standard setting.
- Warm up the engine.
- Turn high speed screw (H) slightly clockwise (leaner) – no further than stop.

NOTICE

After returning from high altitude, reset the carburetor to the standard setting.

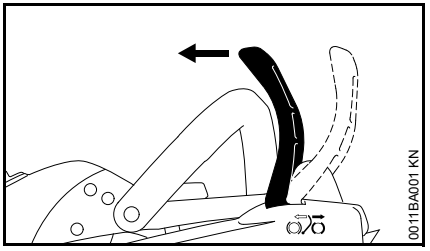
If the setting is too lean there is a risk of engine damage due to insufficient lubrication and overheating.

Spark Plug

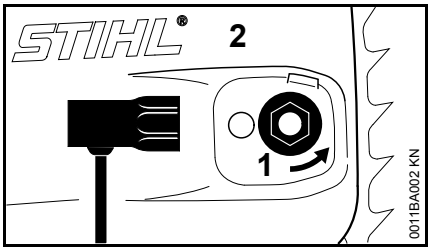
- If the engine is down on power, difficult to start or runs poorly at idle speed, first check the spark plug.
- Fit a new spark plug after about 100 operating hours – or sooner if the electrodes are badly eroded. Install only suppressed spark plugs of the type approved by STIHL – see "Specifications".

Removing the spark plug

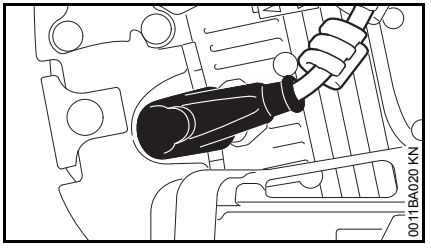
- Move the master control lever to the stop position **0**



- Release the chain brake

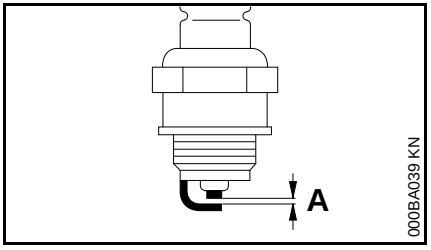


- Turn the captive nut (1) to the left until it hangs loosely in the chain sprocket cover
- Remove the chain sprocket cover (2) with captive nut



- Pull off the spark plug boot
- Unscrew spark plug

Checking the spark plug



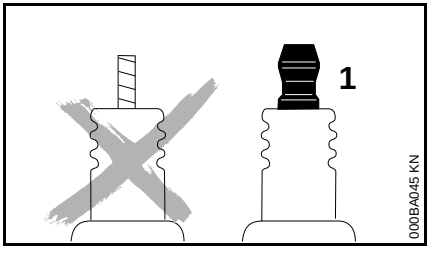
- Clean dirty spark plug.
- Check electrode gap (A) and readjust if necessary – see "Specifications".
- Rectify the problems which have caused fouling of the spark plug.

Possible causes are:

– Too much oil in fuel mix.

– Dirty air filter.

– Unfavorable running conditions.



WARNING

If the spark plug comes with a detachable adapter nut (1), screw the adapter onto the thread and tighten it down **firmly** to reduce the **risk of arcing and fire**.

Installing the spark plug

- Install the spark plug and connect the spark plug boot (press it down firmly) – reassembly all other parts in the reverse sequence.

Rewind Starter

To help prolong the wear life of the starter rope, observe the following points:

- Pull the starter rope only in the direction specified.
- Do not pull the rope over the edge of the guide bushing.
- Do not pull out the rope more than specified.
- Do not allow the starter grip to snap back, guide it back into the housing slowly – see chapter on "Starting / Stopping the Engine."

Have a damaged starter rope replaced by your dealer before it breaks completely. STIHL recommends that you have servicing and repair work carried out exclusively by an authorized STIHL servicing dealer.

Storing the Machine

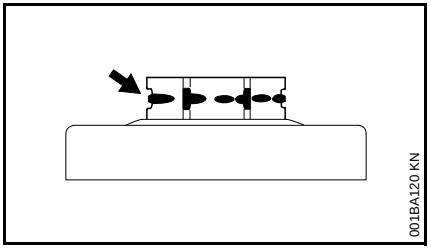
For periods of 3 months or longer

- Drain and clean the fuel tank in a well ventilated area.
- Dispose of fuel properly in accordance with local environmental requirements.
- Run the engine until the carburetor is dry – this helps prevent the carburetor diaphragms sticking together.
- Remove the saw chain and guide bar, clean them and spray with corrosion inhibiting oil.
- Thoroughly clean the machine – pay special attention to the cylinder fins and air filter.
- If you use a biological chain and bar lubricant, e.g. STIHL BioPlus, completely fill the chain oil tank.
- Store the machine in a dry, high or locked location, out of the reach of children and other unauthorized persons.

Checking and Replacing the Chain Sprocket

- Remove chain sprocket cover, saw chain and guide bar
- Release chain brake – pull hand guard against the front handle

Fitting a new chain sprocket



– after use of two saw chains or earlier

– if the wear marks (arrows) are deeper than 0.5 mm – otherwise the service life of the saw chain is reduced – use check gauge (special accessory) to test

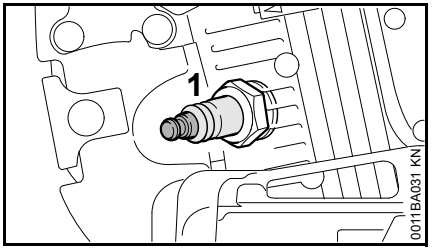
Using two saw chains in alternation helps preserve the chain sprocket.

For the removal and installation of chain sprocket and clutch described in the following, a locking strip is required to immobilize the piston in the cylinder. The locking strip is included with the replacement chain sprocket.

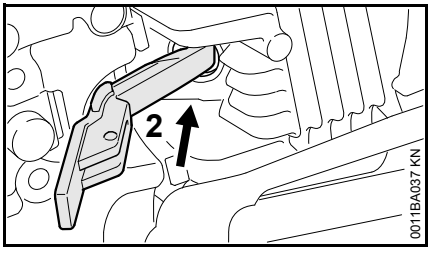
STIHL recommends use of original STIHL chain sprockets in order to ensure optimal functioning of the chain brake.

Removal

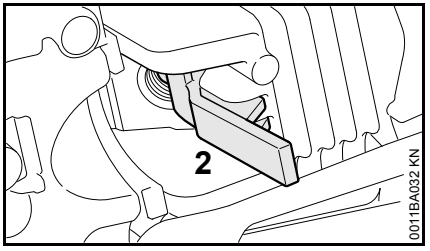
- Pull off the spark plug boot



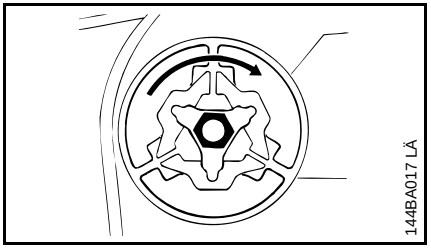
- Unscrew spark plug (1)
- Turn the clutch until the piston is in the lower part of the cylinder



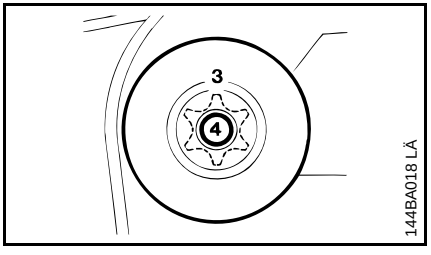
- Insert the locking strip (2) through the opening as far as it will go into the cylinder



- Fasten the locking strip (2) on the cylinder fin
- Turn the clutch clockwise until the piston rests against the locking strip



- Loosen the hexagon of the clutch clockwise (left-handed thread)
- Unscrew clutch



- Remove chain sprocket (3) and needle cage (4) from the crankshaft
- Clean crankshaft stub and needle cage and lubricate with STIHL lubricant (special accessory)

Assembly

- Fit needle cage and chain sprocket on the crankshaft
- Screw the clutch counterclockwise onto the crankshaft
- Tighten the clutch with a torque of 25 Nm
- Remove the locking strip from the cylinder, screw in and tighten the spark plug
- Push the spark plug boot onto the spark plug

Maintaining and Sharpening the Saw Chain

Sawing effortlessly with a properly sharpened saw chain

A properly sharpened saw chain cuts through wood effortlessly even with very little pushing.

Never use a dull or damaged saw chain – this leads to increased physical strain, increased vibration load, unsatisfactory cutting results and increased wear.

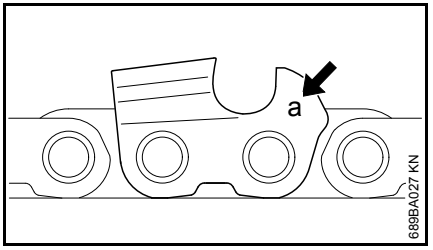
- Clean the saw chain
- Check the saw chain for cracks and damaged rivets
- Replace damaged or worn chain components and adapt these parts to the remaining parts in terms of shape and level of wear – rework accordingly

Carbide-tipped (Duro) saw chains are especially wear-resistant. For an optimal sharpening result, STIHL recommends STIHL servicing dealers.

WARNING

Compliance with the angles and dimensions listed below is absolutely necessary. An improperly sharpened saw chain – especially depth gauges that are too low – can lead to increased kickback tendency of the chain saw – **risk of injury**!

Chain pitch



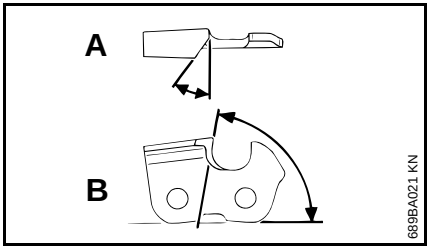
The chain pitch marking (**a**) is embossed in the area of the depth gauge of each cutter.

Marking (**a**)	Chain pitch	
	Inches	mm
7	1/4 P	6.35
1 or 1/4	1/4	6.35
6, P or PM	3/8 P	9.32
2 or 325	0.325	8.25
3 or 3/8	3/8	9.32
4 or 404	0.404	10.26

The diameter of file to be used depends on the chain pitch – see table "Sharpening tools".

The angles of the cutter must be maintained during resharpening.

Sharpening and side plate angles



A Sharpening angle

STIHL saw chains are sharpened with a 30° sharpening angle. Ripping chains, which are sharpened with a 10° sharpening angle, are exceptions. Ripping chains have an X in the designation.

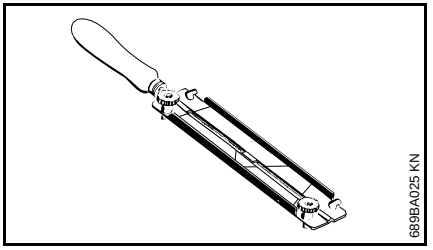
B Side plate angle

The correct side plate angle results automatically when the specified file holder and file diameter are used.

Tooth shapes	Angle (°)	
	A	B
Micro = semi-chisel tooth, e. g., 63 PM3, 26 RM3, 36 RM	30	75
Super = full chisel tooth, e. g., 63 PS3, 26 RS, 36 RS3	30	60
Ripping chain, e. g., 63 PMX, 36 RMX	10	75

The angles must be identical for all cutters in the saw chain. Varying angles: Rough, uneven running of the saw chain, increased wear – even to the point of saw chain breakage.

File holder

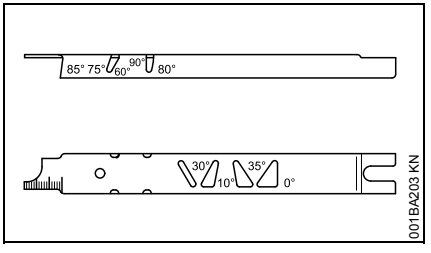


- **Use a file holder**

Always use a file holder (special accessory, see table "Sharpening tools") when sharpening saw chains by hand. File holders have markings for the sharpening angle.

Use only special saw chain files! Other files are unsuitable in terms of shape and type of cutting.

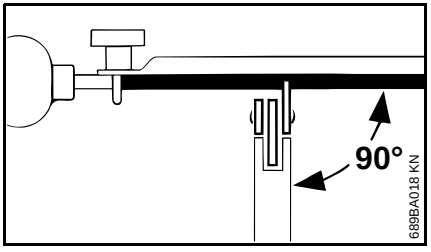
To check the angles

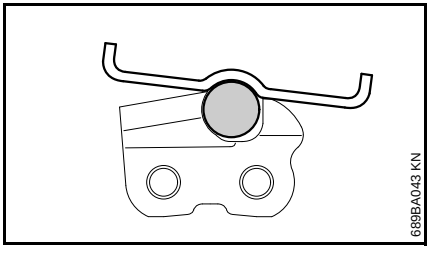


STIHL filing gauge (special accessory, see table "Sharpening tools") – a universal tool for checking sharpening and side plate angles, depth gauge setting, and tooth length, as well as cleaning grooves and oil inlet holes.

Proper sharpening

- Select sharpening tools in accordance with chain pitch
- Clamp guide bar if necessary
- Block saw chain – push the hand guard forward
- To advance the saw chain, pull the hand guard toward the handlebar: The chain brake is disengaged. With the Quickstop Super chain brake system, additionally press the throttle trigger lockout
- Sharpen frequently, removing little material – two or three strokes of the file are usually sufficient for simple resharpening





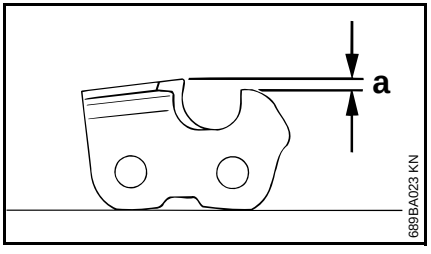
- Guide the file: **horizontally** (at a right angle to the side surface of the guide bar) in accordance with the specified angle – according to the markings on the file holder – rest the file holder on the tooth head and the depth gauge
- File only from the inside outward
- The file only sharpens on the forward stroke – lift the file on the backstroke
- Do not file tie straps and drive links
- Rotate the file a little periodically in order to avoid uneven wear
- To remove file burr, use a piece of hardwood
- Check angle with file gauge

All cutters must be equally long.

With varying cutter lengths, the cutter heights also vary and cause rough running of the saw chain and chain breakage.

- All cutters must be filed down equal to the length of the shortest cutter – ideally, one should have this done by a servicing dealer using an electric sharpener

Depth gauge setting



The depth gauge determines the depth to which the cutter penetrates the wood and thus the chip thickness.

a Required distance between depth gauge and cutting edge

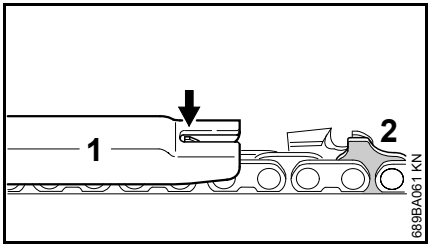
When cutting softwood outside of the frost season, the distance can be increased by up to 0.2 mm (0.008").

Chain pitch		Depth gauge Distance (a)	
Inches	(mm)	mm	(Inches)
1/4 P	(6.35)	0.45	(0.018)
1/4	(6.35)	0.65	(0.026)
3/8 P	(9.32)	0.65	(0.026)
0.325	(8.25)	0.65	(0.026)
3/8	(9.32)	0.65	(0.026)
0.404	(10.26)	0.80	(0.031)

Lowering the depth gauges

The depth gauge setting is lowered when the cutter is sharpened.

- Check the depth gauge setting after each sharpening

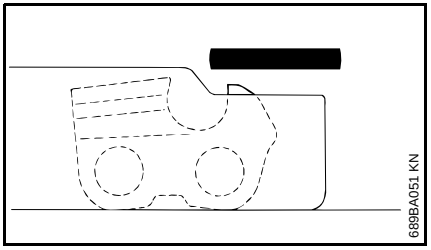


- Lay the appropriate file gauge (1) for the chain pitch on the saw chain and press it against the cutter to be checked – if the depth gauge protrudes past the file gauge, the depth gauge must be reworked

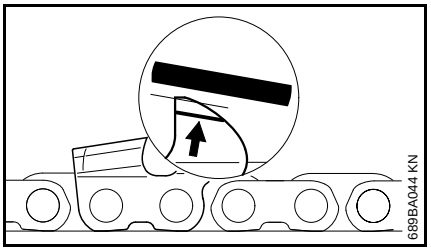
Saw chains with humped drive link (2) – upper part of the humped drive link (2) (with service mark) is lowered at the same time as the depth gauge of the cutter.

WARNING

The rest of the humped drive link must not be filed; otherwise, this could increase the tendency of the chain saw to kick back.



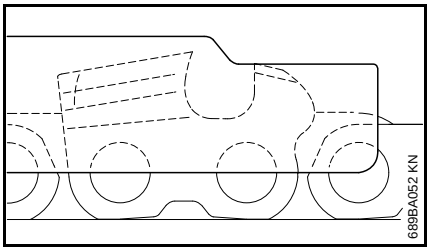
- Rework the depth gauge so that it is flush with the file gauge



- Afterwards, dress the leading edge of the depth gauge parallel to the service mark (see arrow) – when doing this, be careful not to further lower the highest point of the depth gauge

WARNING

Depth gauges that are too low increase the kickback tendency of the chain saw.



- Lay the file gauge on the saw chain – the highest point of the depth gauge must be flush with the file gauge
- After sharpening, clean the saw chain thoroughly, removing any filings or grinding dust – lubricate the saw chain thoroughly
- In the event of extended periods of disuse, store saw chains in cleaned and oiled condition

Sharpening tools (special accessories)

Chain pitch		Round file Ø		Round file	File holder	File gauge	Taper square file	Sharpening set[1)]
Inches	(mm)	mm	(Inches)	Part number	Part number	Part number	Part number	Part number

1) consisting of file holder with round file, taper square file and file gauge

Maintenance and Care

The following maintenance intervals apply to normal usage and operating conditions. If your daily working time is longer or operating conditions are difficult (very dusty work area, resin-rich wood, tropical wood, etc.), shorten the specified intervals accordingly. If you only use your power tool occasionally, extend the intervals accordingly.		before starting work	after finishing work or daily	after each refueling stop	weekly	monthly	every 12 months	if problem	if damaged	as required
Complete machine	Visual inspection (condition, leaks)	X		X						
	Clean		X							
Throttle trigger, trigger lockout, choke lever, stop switch, Master Control lever (depending on version)	Check operation	X		X						
Chain brake	Check operation	X		X						
	Have checked by servicing dealer[1)]									X
Manual fuel pump (if fitted)	Check	X								
	Have repaired by servicing dealer[1)]								X	
Pickup body/filter in fuel tank	Check					X				
	Clean, replace filter element					X		X		
	Replace						X		X	X
Fuel tank	Clean					X				
Chain oil tank	Clean					X				
Chain lubrication	Check	X								
Chain	Inspect, also check sharpness	X		X						
	Check chain tension	X		X						
	Sharpen									X
Guide bar	Check (wear, damage)	X								
	Clean and turn over									X
	Deburr				X					
	Replace								X	X
Chain sprocket	Check				X					
Air filter	Clean							X		X
	Replace								X	

The following maintenance intervals apply to normal usage and operating conditions. If your daily working time is longer or operating conditions are difficult (very dusty work area, resin-rich wood, tropical wood, etc.), shorten the specified intervals accordingly. If you only use your power tool occasionally, extend the intervals accordingly.		before starting work	after finishing work or daily	after each refueling stop	weekly	monthly	every 12 months	if problem	if damaged	as required
Antivibration elements	Check	X						X		
	Have replaced by servicing dealer[1)]								X	
Air inlet on fan housing	Clean		X		X					X
Cylinder fins	Clean		X			X				X
Carburetor	Check idle adjustment – chain must not rotate	X		X						
	Adjust idle speed; if necessary, have saw serviced or repaired by dealer[1)]									X
Spark plug	Readjust electrode gap							X		
	Replace after every 100 hours of operation									
All accessible screws and nuts (not adjusting screws)	Retighten[2)]									X
Chain catcher	Check	X								
	Replace								X	
Exhaust port	Decoke after first 139 hours of operation, then every 150 hours of operation									X
Safety labels	Replace								X	

1) STIHL recommends a STIHL servicing dealer

2) Firmly tighten down the cylinder base screws of professional saws (3.4 kW or more) after 10 to 20 hours of operation.

Minimize Wear and Avoid Damage

Observing the instructions in this manual helps reduce the risk of unnecessary wear and damage to the power tool.

The power tool must be operated, maintained and stored with the due care and attention described in this owner's manual.

The user is responsible for all damage caused by non-observance of the safety precautions, operating and maintenance instructions in this manual. This includes in particular:

- Alterations or modifications to the product not approved by STIHL.
- Using tools or accessories which are neither approved or suitable for the product or are of a poor quality.
- Using the product for purposes for which it was not designed.
- Using the product for sports or competitive events.
- Consequential damage caused by continuing to use the product with defective components.

Maintenance Work

All the operations described in the "Maintenance Chart" must be performed on a regular basis. If these maintenance operations cannot be performed by the owner, they should be performed by a servicing dealer.

STIHL recommends that you have servicing and repair work carried out exclusively by an authorized STIHL servicing dealer. STIHL dealers are regularly given the opportunity to attend training courses and are supplied with the necessary technical information.

If these maintenance operations are not carried out as specified, the user assumes responsibility for any damage that may occur. Among other parts, this includes:

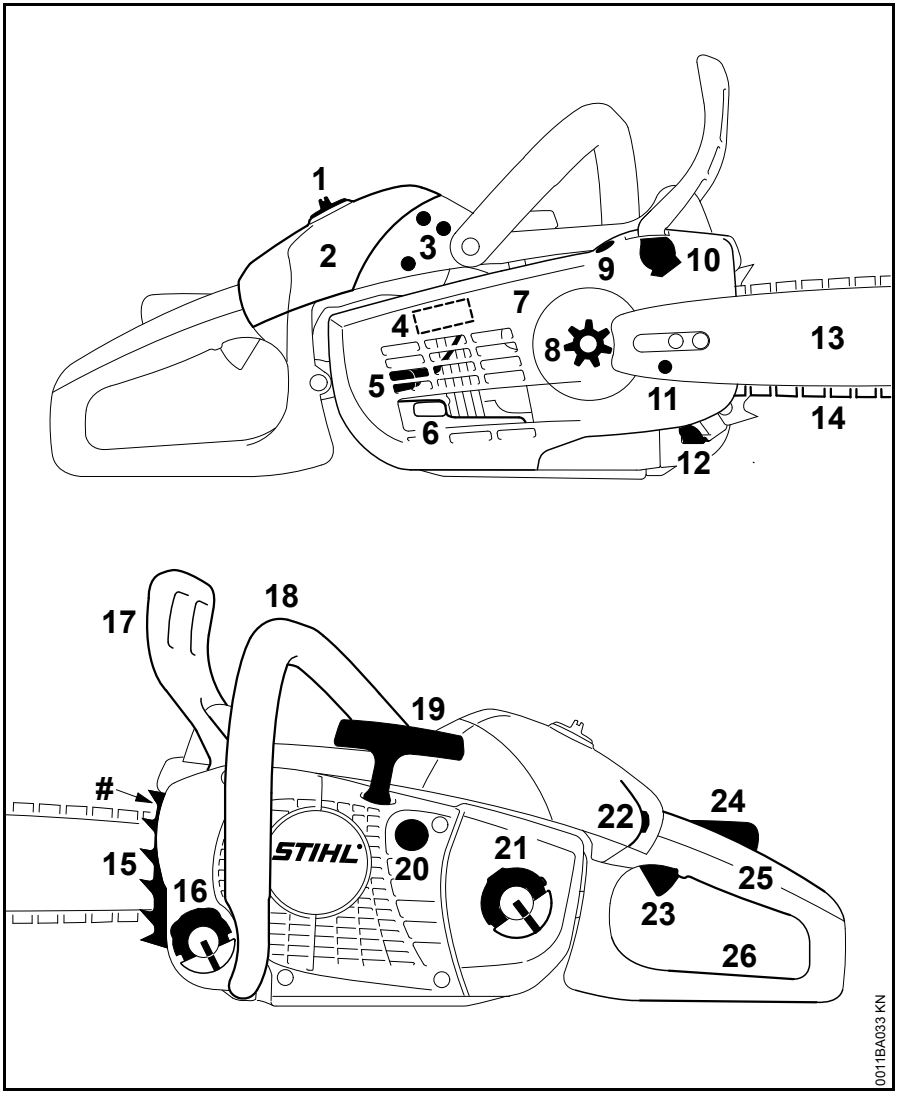
- Damage to the engine due to neglect or deficient maintenance (e.g. air and fuel filters), incorrect carburetor adjustment or inadequate cleaning of cooling air inlets (intake ports, cylinder fins).
- Corrosion and other consequential damage resulting from improper storage.
- Damage to the machine resulting from the use of poor quality replacement parts.

Parts Subject to Wear and Tear

Some parts of the power tool are subject to normal wear and tear even during regular operation in accordance with instructions and, depending on the type and duration of use, have to be replaced in good time. Among other parts, this includes:

- Saw chain, guide bar
- Drive components (clutch, clutch drum, chain sprocket)
- Filters (air, oil, fuel)
- Starter mechanism
- Spark plug
- Components of antivibration system

Main Parts



1 Twist lock
2 Carburetor box cover
3 Carburetor adjusting screws
4 Shutter (winter and summer mode)
5 Spark plug
6 Muffler
7 Chain sprocket cover
8 Chain sprocket
9 Oil quantity control
10 Chain brake
11 Chain tensioner
12 Chain catcher
13 Guide bar
14 Oilomatic chain
15 Spiked bumper
16 Oil filler cap
17 Front hand guard
18 Front handle (handlebar)
19 Starter grip
20 Manual fuel pump (depending on model)
21 Fuel filler cap
22 Master Control lever
23 Throttle trigger
24 Throttle trigger lockout
25 Rear handle
26 Rear hand guard
Serial number

Specifications

Engine

Single cylinder two-stroke engine

Displacement:	35.2 cc
Bore:	40 mm
Stroke:	28 mm
Engine power to ISO 7293:	1.8 kW (2.4 bhp) at 9,500 rpm
Idle speed:[1]	3,000 rpm

1) to ISO 11681 +/- 50 rpm

Ignition System

Electronic magneto ignition

Spark plug (resistor type):	NGK CMR 6 H
Electrode gap:	0.5 mm

Fuel System

All position diaphragm carburetor with integral fuel pump

Fuel tank capacity:	310 cc (0.31 l)

Chain Lubrication

Fully automatic, speed-controlled oil pump. Additional manual oil flow control

Oil tank capacity:	220 cc (0.22 l)

Weight

dry, without bar and chain

MS 201:	3.9 kg
MS 201 C:	4.0 kg

Cutting Attachment

Actual cutting length may be less than the specified length

Rollomatic guide bars

Bar lengths (3/8" P pitch):	30, 35, 40 cm
Groove width:	1.3 mm

Carving guide bars

Bar lengths (1/4" pitch):	25, 30 cm
Groove width:	1.3 mm

3/8" Picco chain

Picco Micro 3 (63 PM3) Type 3636

Pitch:	3/8" P (9.32 mm)
Drive link gauge:	1.3 mm

Picco Super (63 PS) Type 3617

Pitch:	3/8" P (9.32 mm)
Drive link gauge:	1.3 mm

Picco Super 3 (63 PS3) Type 3616

Pitch:	3/8" P (9.32 mm)
Drive link gauge:	1.3 mm

Picco Duro 3 (63 PD3) Type 3612

Pitch:	3/8" P (9.32 mm)
Drive link gauge:	1.3 mm

1/4" chains

Rapid Micro Spezial (13 RMS) Type 3661

Pitch:	1/4" (6.36 mm)
Drive link gauge:	1.3 mm

Chain sprockets

6-tooth for 3/8" P (spur sprocket)

Max. chain velocity to ISO 11681:	23.6 m/s

8-tooth for 1/4" (spur sprocket)

Max. chain velocity to ISO 11681:	21.4 m/s

As a rule, the mean chain velocity in operation is about 20% lower than the maximum chain velocity in accordance with ISO 11681. Contact your STIHL servicing dealer for advice on personal protective equipment.

Noise and Vibration Data

For further details on compliance with Vibration Directive 2002/44/EC see www.stihl.com/vib.

Sound pressure level L_{peq} to ISO 22868

98 dB(A)

Sound power level L_{weq} to ISO 22868

112 dB(A)

Vibration measurement $a_{hv,eq}$ to ISO 22867

	Handle, left	Handle, right
MS 201 C with 3/8" P chain:	2.6 m/s^2	2.7 m/s^2

Vibration measurement $a_{hv,eq}$ to ISO 22867

	Handle, left	Handle, right
MS 201 C with 1/4" P chain:	4.8 m/s^2	4.8 m/s^2

The K-factor in accordance with Directive 2006/42/EC is 2.5 dB(A) for the sound pressure level and sound power level; the K-factor in accordance with Directive 2006/42/EC is 2.0 m/s^2 for the vibration measurement.

REACH

REACH is an EC regulation and stands for the Registration, Evaluation, Authorisation and Restriction of Chemical substances.

For information on compliance with the REACH regulation (EC) No. 1907/2006 see www.stihl.com/reach.

Ordering Spare Parts

Please enter your saw model, serial number as well as the part numbers of the guide bar and saw chain in the spaces provided. This will make re-ordering simpler.

The guide bar and saw chain are subject to normal wear and tear. When purchasing these parts, always quote the saw model, the part numbers and names of the parts.

Model

Serial number

Guide bar part number

Chain part number

Maintenance and Repairs

Users of this machine may only carry out the maintenance and service work described in this user manual. All other repairs must be carried out by a servicing dealer.

STIHL recommends that you have servicing and repair work carried out exclusively by an authorized STIHL servicing dealer. STIHL dealers are regularly given the opportunity to attend training courses and are supplied with the necessary technical information.

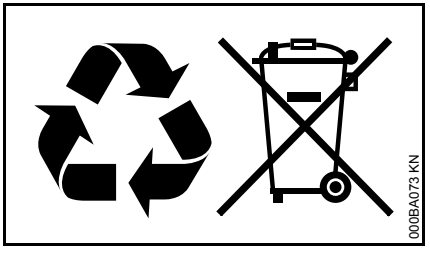
When repairing the machine, only use replacement parts which have been approved by STIHL for this power tool or are technically identical. Only use high-quality replacement parts in order to avoid the risk of accidents and damage to the machine.

STIHL recommends the use of original STIHL replacement parts.

Original STIHL parts can be identified by the STIHL part number, the STIHL® logo and the STIHL parts symbol (the symbol may appear alone on small parts).

Disposal

Observe all country-specific waste disposal rules and regulations.



STIHL products must not be thrown in the garbage can. Take the product, accessories and packaging to an approved disposal site for environment-friendly recycling.

Contact your STIHL servicing dealer for the latest information on waste disposal.

EC Declaration of Conformity

ANDREAS STIHL AG & Co. KG
Badstr. 115
D-71336 Waiblingen

confirms that the product described below

Category:	Chain saw
Make:	STIHL
Model:	MS 201
	MS 201 C
Serial identification:	1145
Displacement:	35.2 cc

conforms to the provisions of Directives 2006/42/EC, 2004/108/EC and 2000/14/EC and has been developed and manufactured in compliance with the following standards in the versions valid at the time of production:

EN ISO 11681-1, EN 61000-6-1, EN 55012

The measured and guaranteed sound power levels were determined according to Directive 2000/14/EC, Annex V, using the ISO 9207 standard.

Measured sound power level

MS 201	112 dB(A)
MS 201 C	112 dB(A)

Guaranteed sound power level

MS 201	114 dB(A)
MS 201 C	114 dB(A)

The EC type examination was carried out by

DPLF
Deutsche Prüf- und Zertifizierungsstelle für Land- und Forsttechnik (NB 0363)
Spremberger Straße 1
D-64823 Groß-Umstadt

Certification No.

K-EG-2010/5599

Technical documents deposited at:

ANDREAS STIHL AG & Co. KG
Produktzulassung (Product Licensing)

The year of manufacture and serial number are applied to the product.
